Ministerial Foreword

Other things may change us, but we start and end with family. (Anthony Brandt)

Families are the bedrock of our society. They nurture children, help to build strength, resilience and moral values in young people, and provide the love and encouragement that helps them lead fulfilling lives. Extended family members provide one another with support throughout life, especially in difficult times and during critical moments, such as when a child is born, when a couple is separating or when relatives need caring for. It is within families that a sense of identity develops, and cultural and social values are passed on from one generation to the next. We often take for granted the fact that families are unparalleled in the sheer range of what they do and provide for us. The family has also shown itself able to endure, shape and adapt to changes in social and economic circumstances, and it continues to do so today. So we see an increasing range of family structures, to the extent that there is arguably no longer a one size fits all family in Britain today. But this is diversity and not decline. Warm, loving and stable relationships matter more for our happiness and wellbeing than the legal form of a relationship. And while marriage will remain of central importance, the reality in many people’s everyday lives is that more and more families experience a range of family forms throughout their life time. There is no single family form that guarantees happiness or success. All types of family can, in the right circumstances, look after their family members, help them get on in life and, for their children, have high hopes and the wherewithal to put them on the path to success. Families are inherently private, of course. But because it is so important to all of us that our children achieve the best they can in life, in every way, Government
also has a duty to think about the kind of support families might need to fulfil the key role they play in society. We know that all families benefit from support at some time or another. Some families need and want more support than others. That support must come hand in hand with the recognition that families have responsibilities too, to family members and to others in society.

For a minority of families, a concern for fairness means on occasions these responsibilities must be enforced. There may still be some who argue that governments should stay out of family policy.

We heard these arguments when we first introduced measures to empower families to make choices about their work life balance – including the right for parents of young children to ask for flexible working; provided support for families such as child tax credits and working family tax credits; and created nearly 3,000 Children’s Centres around the country and invested more than £100 million to expand our network of Parent Support Advisers. But these measures are patently not about government dictating, but about empowering families and enabling them to make the right decisions for them. These successful policies are good examples of how Government can help strengthen families enabling them to help themselves and reduce the pressures they face. This paper and the family policy principles it sets out will, we hope, stimulate further discussion which will continue to inform our work and underpin our ambition for a truly family friendly Britain.

9. A Modern Family Policy
Family is a powerful social institution that matters for children, adults, communities and society

Families matter, are unique and changing

- Families are the bedrock of our society, providing a **wide range of functions**. They nurture children, help to build strength, resilience and moral values in young people, and provide the love and encouragement that helps them lead fulfilling lives. Families are vital in ensuring all children have good life chances and the opportunities to get on in life.

- Families are complex and dynamic. Families provide **support throughout life**, especially during critical moments and in difficult times, such as when a child is born or a couple is separating.

- As an institution family has evolved, shaped and adapted constantly to social changes, and although families have much in common, there is **no such thing as a typical family in 21st Century Britain**. Today, people are marrying later, and it is the norm to live with a partner before marrying. Married couples are more likely to divorce, and more children are born outside of marriage than was previously the case. In addition, the population is ageing, with older people increasingly likely to live alone.
Family composition, circumstances and processes all matter for families. But strong and healthy relationships matter most.

- Family composition, circumstances and processes matter for outcomes of families – but not in equal measure.
- Families with strong and healthy relationships have the ability to develop positive outcomes for the whole family.
- Increased pluralism of family structures need not lead to poorer outcomes, since evidence suggests that the quality of relationships and families’ circumstances have a greater effect on outcomes than the legal structure of a family. Strong and healthy relationships are therefore paramount regardless of the structure.
- Poor material circumstances, emotional distress, and ill health reinforce other disadvantages for children and adults. Absent fathers and mothers may contribute to these adverse effects, and make it harder for families to achieve positive outcomes.
Families are inherently private and individuals have responsibilities towards each other. But their actions have a societal dimension and levels of need vary, and therefore Government has a role.

**Why Government support matters**

- The wellbeing of a family depends upon the commitment and behaviours of the individuals within it.
- Government does not bring up children, parents do. Government does not build good relationships, individuals do.
- Families have to fulfil their responsibilities. But there are three main reasons why the Government should have a strong, supportive family policy:
  - First, while all families will make decisions that are entirely private to its members, there are areas in which the decisions or circumstances of a family will **impact upon society more generally**.
  - Second, families may not always have the **information** they need to do the best for themselves and their members.
  - Thirdly, the Government has a role to play in addressing **inequalities** as families have different levels of need and capability.
- But where possible Government should work in partnership with families, and the private and voluntary sectors.
However, family policy should be guided by a clear set of principles

- Any set of policies designed to build the skills and capabilities of families or to reduce the pressures on them must be judged against principles to ensure they give every family the best possible chance of thriving
  - **Family policy should be empowering**, giving people the information to make choices for themselves, helping them balance rights and responsibilities and fuelling aspiration to achieve their full potential
  - **Intervention should be proportionate**, recognising that families are their own experts on what is right for them but that they also have responsibilities for members and wider society
  - A modern family policy **should not exclude families based on form or structure**
  - Universal support should be complemented with targeted support for those in genuine need to **help secure equal opportunities**
- These principles are complementary but in practice there are often trade-offs between them

9 A Modern Family Policy
The family dominates public and policy debate and there is much discussion about the state of family in Britain. This paper assembles the key trends and sets out a framework to think about the family.

The aim of this paper is to provide a framework to:

1. take stock of family life in Britain and map recent trends and changes as well as explore future pressures on families
2. understand what lies behind headline trends and changes and highlight the complexity and interdependencies of drivers and outcomes
3. understand the implications of these changes and trends for family and wider societal outcomes
4. define the role of Government in supporting and intervening in families and derive policy principles to guide a modern family policy

For the purpose of this paper we define family by what families do (functional definition) rather than by a particular form or legal structure. The paper postulates that everybody is part of a family at some time in their lives and what family is and does depends on the particular life-stage of an individual. The framework developed is highly stylised but enables us to think more strategically about families.
This document will provide a framework for understanding the family, identify how it has changed and in the light of the evidence, set out the principles underlying the Government’s family policy

This chapter

Develops an analytical framework for understanding why family matters

Chapters 4 - 6

Identifies key trends affecting family over recent decades and proposes drivers

Chapter 7

Identifies future trends of importance for family

Chapter 8

Assesses the implications of past and future trends for outcomes

Chapter 9

Suggests a series of policy principles to distil the evidence into a framework for modern family policy
The family can be thought of as an institution which is unique in the wide range of functions it provides, which in turn lead to outcomes for children, adults and society.

What families can do in principle is universal and has changed little over time…

…but outcomes are highly context specific

Family functions
What families can do

Examples include
- Emotional support
- Parenting
- Division of labour

Outcomes of families
What families achieve

Outcomes fall in three categories:
- Material
- Emotional
- Physical wellbeing
Whilst the range of functions that a family can theoretically provide is universal, the relative importance of a function depends on the family context…

Examples of family functions fall broadly into two categories

- **Instrumental**
  - Child supervision
  - Creation and transmission of cultural and social capital
  - Division of domestic and paid labour
  - Risk sharing between partners or different generations

- **Affectionate**
  - Loving and nurturing children
  - Romantic relationships and companionship
  - Sense of belonging

Functions concerning children are only important at certain points in a family’s life course…

…whereas a family can provide an important sense of identity throughout life.
Examples of outcomes of families for adults and children fall broadly into three categories:

**Physical wellbeing**
- Lead healthy lives
- Receive good quality care when needed
- Be safe from injury, accident and crime

**Emotional wellbeing**
- Be safe from maltreatment and discrimination
- Achieve a work-life balance
- Enjoy education or employment
- Enjoy positive relationships with friends and within communities

**Material wellbeing**
- Engage in education or employment
- Live in households free from low income and social exclusion
Outcomes of families affect not only children and adults but also communities and society

Families play a number of roles in society:

- **Children**
  - Create a setting for children to be born, raised and nurtured
  - Help children to fulfil their potential and opportunities in life through emotional, physical and material support by parents and extended family

- **Adults**
  - Provide emotional fulfilment that enhances individuals’ self-worth
  - Enable intergenerational and informal support between family members
  - Enlarge the economic opportunities of family members

- **Community**
  - Help create strong and sustainable communities
  - Contribute to social cohesion and crime reduction

- **Society**
  - The successful upbringing of children brings social and economic prosperity to society
  - Good family outcomes reduce the need for some public services e.g. provision of care, reduced costs of crime and poverty
The family is constantly changing, adapting to new challenges. Government’s chief concern should be where there are implications for outcomes

The family is changing, as it always has

- The family is one of the oldest and most powerful social institutions which is found in almost all societies around the world.
- As such, it has evolved, shaped and adapted constantly to social changes – though public perceptions of what family should be tend to change more slowly.
- Family forms and attitudes fluctuate – e.g. lone parenthood rates in the 15th century were very similar compared to current rates but much lower in other times.
- The nuclear family ideal advocated by some has had a varied existence and the 1950s and 1960s were a historical peak rather than the end of a longstanding ideal type.

Why we care about change

- As Government we should be concerned about family change only if those changes affect outcomes – not because of change per se.
- We therefore need to understand which trends and changes matter and why; and if and how policy might respond.
- Government’s response must be informed by evidence.
Understanding the impact of change on family outcomes is therefore vital. The many drivers of family outcomes can be grouped into categories; the following three chapters deal with each in turn.

Families provide certain functions…

…and the interaction of composition, circumstances and processes…

…determines the outcomes for children, adults, the community and society.

There are strong interdependencies between composition, processes and circumstances.

Understanding the relative importance of drivers and the interdependencies in each category is vital but challenging.

8. Implications
9. A Modern Family Policy
By family composition we mean who makes up a family, and the type and the structure of the underpinning relationships.
### Summary of changes in family composition

#### Facts
- Marriage rates have declined and the number of cohabiting couples has increased.
- Divorce rates rose until the 1980s and have declined slightly ever since.
- Relationship types have become more fluid and family composition now changes more frequently over the life course.
- Fertility rates declined until the 1980s but have recently begun to increase again.

#### Drivers
- Changes in social norms reflect widespread acceptance of alternative family forms.
- Legislation around family breakdown both reflects and drives changes in family composition and social norms.
- Changes in women’s employment and the availability of contraception have altered the timing of family formation.
- People expect more romantic love and emotional closeness in relationships.
- For most drivers, the effects are bidirectional and reinforcing e.g. changes in social norms are also the result of greater plurality in family forms.
Living arrangements are diverse and changing. Taking a snapshot, the majority of households have no dependent children but most are part of an extended family or a relationship.

Family forms are diverse and cut across household structures
Households, millions

- **All households**: 24.2
- **One person households**: 6.8
- **Couples without children**: 6.8
- **Couples with children**: 7.0
- **Lone parents**: 2.4
- **Multi family / two or more unrelated adults**: 1.21

The average household size fell from 2.9 persons per household in 1971 to 2.4 in 2006\(^1\). Household size varies considerably by ethnicity\(^1\).

One person households increased from 18% to 29% between 1971 and 2007; this reflects, in part, young people’s postponement of relationship formation, high rates of relationship breakdown and increased longevity among the elderly\(^2\).

Amongst households with only one adult or several unrelated adults, there are ~2m people in relationships not living together\(^3a\).

- Family ties stretch beyond household living arrangements: 73% of people belong to three, four or even five generation families\(^4\).
- An increasing percentage of couple families with children are stepfamilies\(^5\).

Source: (1) ONS Focus on Families 2007 (2) Social Trends 37, ONS 2007 (3) Population Trends 122 ONS (4) Natcen 1999 BSA 16th report; (5) Ferri and Smith 2003 Notes: (a) people aged 16–59 who report having a regular partner who lives elsewhere (excluding students or a child of a ‘household reporting person’).
There has been a decline in marriage over the long term in the UK and also other European countries

The total number of marriages has declined since the 1950s
Number of marriages, divorces, and remarriages, UK, (thousands)¹

- Marriages in England and Wales fell by 4% in 2006 to 236,980: the lowest number of marriages since 1895¹
- In 2006, the England and Wales marriage rate (number married per 1000 people aged 16+) was 22.8 for men, down from 24.5 in 2005. The marriage rate for women in 2006 was 20.5 down from 21.9 in 2005¹
- However, around 7 in 10 families were headed by a married couple in 2006²

Most European countries have experienced a similar decline in marriage rates
Marriage rate per 1000³

- UK marriage rates have been higher than the euro zone average but the difference has narrowed consistently due to greater decline³
- The mean age at first marriage went up for females in the EU-25 from 23 to 27, and in the former EU-15 from 23 to almost 28 between 1960 and 2005³

Divorce rates have increased since the 1970s. While the UK divorce rate is still high compared to other countries, it has recently started to fall.

The UK divorce rate is high compared to other countries…
Divorces per 1000 inhabitants, 2005¹

- The divorce rate in the former EU-15 has now caught up with the new Member States¹
- Divorce rates are higher for any given marriage duration in more recent marriage cohorts³
- The median duration of marriage at time of divorce however has decreased only slightly from 12.7 years in 1965 to 11.6 years in 2005⁴

…but the rate peaked in the mid-1980s and has been stable or declining ever since
Divorces per 1000 inhabitants, 1960-2005¹

- Divorces in the EU have near quadrupled since 1960¹
- The divorces to marriages ratio was 25:100 in 1973; 55:100 in 2005². However the 2007 UK divorce rate was 11.9 divorcing people per 1,000 married population: its lowest since 1981³
- Since 1997 the average age at divorce in England and Wales has risen from 40.2 to 43.7 years for men and from 37.7 to 41.2 years for women³

Cohabitation has become more popular but mostly as a ‘trial-marriage’. Stepfamilies have increased and make up one tenth of all families with children.

**Pre-marital cohabitation has become far more common**
Per cent by year of first marriage

- The percentage of working age people cohabiting increased from 2% in the 1970s to over 10% in the late 1990s. Cohabiting couple families made up 9% of all families in 1971 and 14% of families in 2006.
- The median duration of cohabitation is just under 2 years. About three in five first cohabitations turn into marriage.
- Less than a fifth of cohabitating unions survive 5 years or more, less than a tenth survive 10 years or more.

**The proportion of stepfamilies has grown**
Per cent of all fathers being stepfathers at age 30, by birth cohort

- Step families are one of the fastest growing family form in the UK.
- In 2005, 10% of families with dependent children were step-families.
- 30% of all mothers will spend some time in a stepfamily during their adulthood before age 45.
- Two-fifths of all marriages are remarriages.

Civil partnership is relatively new family structure and Living Apart Together is a relatively new relationship form

More than 18,000 civil partnerships have formed
Number of civil partnerships (total left, quarterly total right)¹

- An estimated six per cent of the population, or about 3.6 million Britons, are either gay or lesbian²
- The Civil Partnership Act 2004 came into force in December 2005 and enables same-sex couples to obtain legal recognition of their relationship
- 10% of all men and 25% of all women forming a civil partnership in the UK had been in a previous marriage

Being in relationships but not living together is becoming an important relationship form
Millions, Great Britain 2002-03³

- Being in a relationship but not living together: people aged 16–59 who report having a regular partner who lives elsewhere (excluding students or a child of a household reporting person)³
- Estimates suggest three in ten men and women aged 16-59 not currently married or coresidentially cohabiting have a partner living elsewhere; of those, half - about 2 million - might be said to be LAT³

Source: (1) ONS 2007 (2) HMT Civil Partnership RIA estimate (3) Population Trends 122 ONS
Fertility rates declined in the second half of the 20th century but have recently begun to increase. The proportion of births occurring outside marriage has risen constantly.

**Fertility rates fell rapidly in the 1960s-70s and remained relatively stable thereafter**

Total fertility rate, England and Wales 1938-2004

- UK Total Fertility Rate (TFR) is about 1.9 children in 2007 – among the highest in the EU
- The UK TFR has increased each year since the record low of 1.63 in 2001. Only part of the recent increase is driven by immigration: the TFR for women born in the UK rose substantially from 1.68 in 2004 to 1.79 in 2007
- Fertility in England and Wales has been below replacement level since 1973

**Births outside marriage have increased, especially those to cohabiting couples**

% of all live births, England and Wales 1971-2006

- Births outside marriage have gone up from about 10% in the 1970s to over 40% in the 2000s
- Most of that increase took place among birth to cohabiting couples
- Solely registered births out of wedlock have been on the decline over the past decade

Source: (1) ONS (2) Population Trends 119 (3) ONS Population Trends 132. Note: Total fertility rate (TFR) is the average number of children a woman would bear if the female population experienced the age-specific fertility rates of the calendar year in question throughout their childbearing lifespan. 2007 TFR is provisional.
People are delaying parenthood and women with higher education levels have fewer children

Conceptions are rising significantly in the over 40s
Relative changes in age-specific conception rates, England and Wales, 1990-2006 (1990=100)¹

- Since the 1980s, the proportion of children being born to older mothers has increased as women delay having children until later in life¹
- For example, in 1981, 1.4% of 35-44 year olds gave birth during the year; by 2004, 2.9% did¹
- Women’s average age at first birth was 27.6 in 2006²

Completed family size varies significantly by education
Estimates of average no. of children by birth cohort, 1945-1965³

- British men and women at childbearing age desire on average 2.5 children⁴
- Although women’s desired number of children varies little by education when they are in their early 20s, women with college education end up having fewer children³
- The fertility difference between women with low and high levels of education has widened³

Source: (1) ONS Conception statistics in England and Wales, 2006; (2) ONS Birth Statistics, 2006; (3) Smith and Ratcliffe 2007, based on Family Expenditure Survey (FES) and Family Resources Survey (FRS); (4) Goldstein, Lutz et al 2004
Teenage pregnancies are falling and are at the lowest for 20 years. Abortion rates are increasing slightly among young women.

- The 2006 under-18 conception rate for England of 40.4 per 1000 girls aged 15-17 represents an overall decline of 13.3% since 1998. However teenage pregnancy rates in Britain remain among the highest across developed countries.
- 49% of teenage mothers live in the most deprived 20% of areas. There are also clear differences among ethnic groups.

In 2007 the Eng & Wales age-standardised abortion rate was 18.6 per 1,000 resident women aged 15-44, compared with 18.3 in 2006.
32% of women undergoing abortions in 2007 had one or more previous abortions (28% in 1997).
81% of abortions in 2006 were carried out for single women, a proportion that has risen slowly from about two thirds since 1997.

The number of children growing up in lone parent families has increased considerably, and significant numbers of children now live in stepfamilies.

- In 2007 the proportion of lone parents as heads of households (12 per cent) was treble that of 1971 (4 per cent) \(^2\)
- 5% of multi generational families are headed by a lone parent, this includes large proportions of lone parents aged 19 or younger \(^3\)

**There are more children in lone parent families**

% of all dependent children in each family type Great Britain 1972 - 2005 \(^1\)

**The majority of stepfamilies include children from the mother’s previous relationship**

- There were 0.7 million stepfamilies (about 10% of all families with dependent children) living in the UK in 2005 \(^3\). 0.4 million were married couple stepfamilies, 0.3 million were cohabiting couple stepfamilies \(^3\)
- Estimates suggest the number of children in stepfamilies increased from 1 in 15 to 1 in 10 between 1990 and 2001 \(^4\)

Source: (1) General Household Survey 2005 (2) Social Trends 38 (3) ONS Focus on Families (4) Haskey 1994 in SIRC (forthcoming)
The following slides discuss the drivers of these trends in family composition.

What lies behind these changes in family form and structure?

- To what extent have social norms towards family forms changed in parallel with behaviour?
- How important have changes in family law and contraception been?
- What impact did the expansion of female education and employment have?
Social norms around marriage, cohabitation and divorce have become more liberal. Alternative life-styles have gained widespread acceptance.

**Acceptance of alternative family forms to marriage and of divorce has increased**
Percentage of people who agree that people who want children ought to get married, 1989-2000\(^1\)

- Acceptance of cohabitation preceding and replacing marriage has increased but 28% of people still believe married couples make better parents than unmarried couples\(^2\)
- 78% believe it is parental conflict rather than divorce which harms children\(^2\)
- 63% think divorce can be a positive first step towards a new life\(^2\)

**Acceptance of same sex relationships has increased**
Percentage of people who agree that sexual relations between two adults of the same sex are rarely or never wrong, 1983-2006\(^2\)

- 63% believe that same sex couples can be equally committed partners\(^2\)
- Reservations remain regarding parenthood: only about one third of people believe same sex couples can be equally good parents as heterosexual couples\(^2\)

Source: (1) BSA 18\(^{th}\) report 2001 (2) BSA 24\(^{th}\) report 2008
Religious observance has declined and sex before marriage is widely accepted. In a relationship, however, fidelity remains important.

**Religious service attendance declined strongly while more people now have no religious affiliation**

Percentage, 1964 - 2005

- 71% of respondents to the British Social Attitudes survey regularly attended religious services in 1964 compared with 31% in 2005.
- The percentage of people stating no religious affiliation increased more strongly than those belonging to a religion but not attending services.
- Between 1979 and 2005, half of all Christians stopped going to church on a Sunday.

**Attitudes have become more liberal towards premarital sex but not regarding extramarital sex**

Percentage, 1984 - 2006

- 70% of people think there is nothing wrong with sex before marriage, compared with 48% in 1984.
- However an unchanged 85% of people disapprove of extramarital sex.
- The pill was introduced in 1961. By 2005, 75% of British women were using at least one method of contraception (25% of women use the pill). Sexuality is losing its value in exchange for commitment.

Whether legislation drives or reacts to changing social norms is a matter of debate, but people do believe it has some impact on family composition.

Divorce and family law has seen considerable change since the 1960s

- The Divorce Reform Act 1969 introduced a single ground for divorce (‘irretrievable breakdown’). This Act probably contributed to the stark rise in divorce rates.
- The other legislative acts have changed proceedings upon relationship breakdown.

People ascribe the increase in divorce to legislative change

- Does a higher divorce rate today mean marriage is less successful, or just that divorce is easier?

The Divorce Reform Act 1969 introduced a single ground for divorce (‘irretrievable breakdown’). This Act probably contributed to the stark rise in divorce rates.

The other legislative acts have changed proceedings upon relationship breakdown.

- Estimates suggest that the legal reforms account for about 20 percent of the increase in divorce rates in Europe between 1960 and 2002.
- The Scottish Family Law Act 2006 has given cohabitants some similar rights on relationship breakdown as married couples. This debate is ongoing in England and Wales.

Source: (1) Marriage, Divorce and Adoption Statistics 2005 ONS (2) González and Viitanen IZA discussion paper 2006 (3) 2007 Barlow et al in BSA 2008
People have greater opportunity to find the right partner, and a greater diversity of relationship types are on offer; but what they expect from those relationships may also have changed

- In a survey of UK singles aged 18-59, 52% of men and 48% of women in the UK have used the internet to find a date
- Those aged 30-40 are the most likely to use the internet (in particular women) tailing off for later age groups
- On average, British singles have had 1.9 relationships compared to 2.6 for Germans

- Honesty, ability to communicate, openness, humour and fidelity are attributes most people are looking for in relationships
- More women (88%) than men (76%) are looking for equality in relationships
- However 47% of women also want their partner to protect them, while 25% expect him to offer an upscale standard of living

Source: (1) PARSHIP Survey 2008 (2) Simpson, Campbell, Berscheid, 1986
Better education has been an important factor in women marrying later, and delaying childbirth

Highly educated women led the move to later marriage, but low educated have now overtaken
Median age at first marriage by birth cohort, BHPS

- Cohabitation was more likely for more educated women for women born in 1950s and 1960s
- More educated were pioneers in cohabitation. Less educated women had caught up by 1970s cohort
- The average age at first marriage rose from 25.5 years in 1991 to 29.5 in 2005. Cohabitation is also now delayed - 8% of 16-19 year old women were cohabiting in 2001 compared with 2% in 2006

Median age at motherhood significantly increased for more educated women
Median age at motherhood by birth cohort, BHPS

- Less educated women were always more likely to have children outside marriage
- Within cohabiting unions, educational differences in first birth rates are widening across birth cohorts
- Outside of cohabiting unions, educational differences in first birth rates are widening even more across birth cohorts

Source: (1) Adopted from J. Ermisch in Changing household and family structures and complex living arrangements ESRC 2006; (2) Population Trends, ONS (3) SIRC forthcoming 2009
Factors such as the expansion of women’s education and employment have improved opportunities and affected the gender power balance in relationships.

**Women’s participation in higher education has now overtaken men’s**
Per cent of women attending higher education relative to men¹

- 32% of young women in maintained schools are in Higher Education by age 19, compared to 25% of young men in maintained schools¹
- 17.5% of professors in higher education institutions are now women⁶

**More women have entered the formal workforce**
Per cent active by gender²

- In 1978 the percent of women employed in the public sector was 33; by 2007 it was 39⁵
- While childless women have similar employment rates to men, there remains a large difference between employment rates of mothers and fathers²
- Employment rates of mothers are particularly low for those with low levels of education³
- In 2007, the full-time and part-time gender pay gaps were 17.2% and 35.6% higher than the EU average but there has been a downward trend since 2003⁴

9 A Modern Family Policy
By family processes we mean the way families make decisions about the allocation of time, money and relationship resources in order to produce certain outcomes.
<table>
<thead>
<tr>
<th>Facts</th>
<th>Drivers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dual earner couples are increasing but mothers with small children mostly work part-time</td>
<td>The increase in women’s education and technological advance of household appliances have helped the expansion of women’s employment</td>
</tr>
<tr>
<td>Most mothers remain mainly responsible for childcare and housework. Fathers’ and mothers’ childcare time has increased</td>
<td>Women and men aspire to more egalitarian (even if not equal) gender roles in employment and family life; partly also as a result of the increase in women’s employment</td>
</tr>
<tr>
<td>Parents place greater emphasis on parent-child interaction and educational activities</td>
<td>People remain very committed to family life and providing informal care</td>
</tr>
<tr>
<td>Reduced couple time and more conflict presents new challenges to relationships</td>
<td>Policy changes in terms of flexible working, leave and childcare support families’ work-life balance</td>
</tr>
</tbody>
</table>
The increase in female employment has eroded the traditional male breadwinner / female homemaker model. Women’s working patterns however are still strongly related to the presence and age of children.

**Households with all adults in paid work as well as workless households have increased**

Percentage of all working age households, 1965-1998, FES & FLS¹

- Women’s employment rate has increased sharply from 59% to 73%, while men’s decreased from 95 to 83% between 1971-2005²
- Measured in full-time equivalent, women’s employment rate however was only 52 per cent in 2005³
- The rate of female part-time employment remained unchanged at about 40% between 1980 and 2003⁴

**The older the child, the higher the percentage of mothers working**

Age of youngest child, 2005 DWP (%)⁵

- 53% of lone parents were working more than 15 hours, 42% were not working⁶
- Among couples with young children in 2002, about 40% of women worked part-time compared to 17% full-time and 35% who did not work for pay⁶

Sources: (1) Gregg, Hansen, and Wadsworth 1999 based on FES (2) ONS LFS various waves; (3) Lewis, Campbell et al. 2008 (4) OECD Babies and bosses Vol 4 (5) DWP FACS annual report 2005; (6) Harkness 2003
Full time working hours are relatively high for UK males. Women’s part-time employment hours are increasing slightly but are still relatively low compared to most other European countries.

### The UK has still very high male working hours in full time employment, though they have declined

**Hours (FT, % change 1997-06)**

- **Sweden**: 41.2%, 2015
- **Finland**: 47.1%, 2015
- **Italy**: 37.0%, 2015
- **UK**: 44.8%, 2015
- **EU**: 40.5%, 2015

<table>

- **Italy**: 37.0%, 2015
- **UK**: 44.8%, 2015
- **EU**: 40.5%, 2015

#### Processes

- 5.1% of men in Sweden work more than 44 hours a week, compared to 41.8% in the UK
- The UK also has a much wider range of working hours than Scandinavia. 87% of Swedish men work 35-44 hours per week compared to 51% in the UK
- However, there has been a 7% reduction in the percentage of men working > 40 hours per week between 1985-2005

#### Drivers

- 16.7% of UK working-age women work between 1-19 hours per week and 18.1% work 20-29 hours per week. This compares with 4.9% and 12.6% in Sweden, and 6.5% and 6.6% in Finland
- In the UK, working hours of partnered and single mothers with children have gone up since 1997

### Women’s part-time work hours are increasing but are still comparatively low in the UK

**Hours (PT, % change 1997-06)**

- **Sweden**: 8.0%, 2015
- **Finland**: 6.5%, 2015
- **Italy**: 6.5%, 2015
- **UK**: 9.6%, 2015
- **EU**: 5.0%, 2015

Couples’ combined work hours have increased on average. However there is also a significant counter-trend towards ‘downshifting’

Family work hours increased over the 1990s; the rise was largest among parents of small children
Mean of household's normal weekly work hours, 1992-2002

- Large variations remain between people with high and low levels of education
- Increases are concentrated among dual earner couples and single parents, while working hours in male breadwinner couples decreased
- Before the 1990s, the pace of change was probably even faster

Most people downshift because they want to spend more time with their family
Why Britons downshift (%)

- 25% of British adults aged 30-59 have downshifted over the last ten years
- Most who downshift stop working, reduce their hours or change their career
- 90% of downshifters are happy with their decision, with two in five saying that they do not miss the extra income at all but another two in five did miss the money. Only 6% were unhappy with the decision

Sources: (1) Harkness 2003 (2) Jacobs and Gerson 1998 (3) Hamilton 2003, Downshifting in Britain
Women’s housework time has decreased strongly. Couples’ division of domestic labour has changed as well but is far from equal

Women remain mainly responsible for most of the housework
Percentage of partnered people saying that task is usually done by woman¹

- British women’s time spent on housework decreased significantly, while men’s increased slightly between 1975 and the early 1990s²
- Childcare time more than doubled among fathers while it increased by about two thirds for mothers²
- Change in housework slowed down during the 1990s, while it continued for childcare¹

The division of domestic work is similarly unequal among most European countries
Share of total domestic work time by gender (%)³

- Only Scandinavian countries show a slightly more equal allocation of domestic work than the UK³
- Women and men’s total time spent on paid and unpaid labour is about equal except in Eastern Europe where women work longer hours³
- Mothers do more multitasking and have less uninterrupted leisure time than fathers⁴,⁵,⁶
Mothers and fathers both spend more time with their children than they did in the past...

There is evidence that parents spend more time with their children than in the past
Mean minutes per day spent on childcare as primary or secondary activity

In 2000, children spent on average just under 4 hours on weekdays and 6 ½ hours on weekend days with their parents
Employed mothers spend less total time but the same amount of ‘quality time’ with children
In 2008, three quarters of families regularly had a family meal together at home; this does not seem to have declined significantly from earlier periods

Evidence from the US suggests time spent on teaching and playing has increased more than time spent on routine childcare
Time spent on teaching and playing as proportion of total primary childcare

Fathers’ time on routine care and play / teaching activities has increased markedly
The increase in time with children is likely to be due to greater knowledge about parenting, and intensive care ideals
Peer pressure may be increasing expectations. 63% of mothers and 51% of fathers worry about whether they are doing a good job

...but parents with dependent children spend less time together as a couple. Despite this people’s satisfaction with their relationships has remained relatively stable.

There is US evidence that marital happiness has decreased over the past decades
Percentage of people in first marriages reporting “very happy” marriages, US General Social Survey

- When remarriages are taken into account, the reduction of “very happy” marriages is even greater
- Women are less happy than men
- Women report more and men less influence over family issues compared to previous cohorts
- Marital conflict has increased while couples’ interaction time decreased since the 1970s

British couples’ satisfaction with their partner is unchanged since 1996
How satisfied are you with your partner? mean response on scale 1-7

- Women with preschool children report greater satisfaction in more recent years
- The presence of children decreases the time couples spend together and a greater part of adults’ leisure time is now spent with their children
- Pressures to combine work and family life and lack of couple time are greatest among couples with young children and both partners work full-time

Frequency of contact outside the immediate family has declined slightly but generational ties remain important. Grandparents play a key role in informal childcare.

**Fewer people see relatives and friends frequently**
Percentage of people seeing a relative or best friend min. once a week

- 65% of people lived within an hour’s journey from a relative in 1995, down only slightly from 68% in 1985
- Just under 40% of grandparents live within 15 minutes’ travel and see their grandchild several times a week
- Overall, 68% of grandparents feel very close to their grandchild

**Maternal grandparents become more important when parents separate**
Percentage of grandparents with contact to grandchild under age 16

- A quarter of families use grandparent childcare each week, with their care valued at £3.9 billion each year
- Grandparents’ help has an important influence on whether mothers of young children take employment, especially those with lower earnings potential and those who work part-time

Sources: (1) NatCen BSA 16th report 1999 (2) Cabinet Office Strategy Unit Realising Britain's Potential: Future Strategic Challenges for Britain 2008
Family ties also remain important for the increasing provision of adult care in addition to care by friends or neighbours

Family provides the main source of informal care
% of people with respective relationship to carer

- A third of carers were the only unpaid caring support for the main person cared for. The remainder shared their caring responsibilities with others.
- Emotional closeness between adult children and their parents seems to have increased: At age 42, men and women born in 1958 were more likely to feel emotionally close to their parents than those in the 1946 cohort.

The proportion and numbers of carers has slowly increased
Number and percentage of carers

- Demand from older people for unpaid care has risen over the 1990s and is forecast to grow further.
- The majority of all care received is unpaid care: 1.79m people over age of 65 receive some informal care compared to 1.54m receiving help from formal professional services in 2007.

Sources: (1) FRS 2005/6 (2) York Uni 2000 (3) Ferri and Smith 2003 (4) PSSRU 2007 modeling for DH/SU
The following slides discuss the drivers of these trends in family processes:

**Drivers**

**Why have we seen these changes in the way families live their lives?**

- How have time-saving household appliances spread over time?
- How have gender role attitudes and family values changed?
- What has been the role of work-life balance policies?
Women’s educational levels have improved considerably in the 2nd half of the 20th century. Technological advances in household appliances contributed to reducing housework time.

### Time-saving household appliances spread from the 1950s; diffusion of the TV was even faster

Diffusion levels of selected household appliances as % of all wired households, England and Wales

- Many time-saving household appliances were invented after the 1st World War but spread widely only as income levels increased in the 1950s-60s
- ‘Time-using’ home entertainment like the TV took off even faster and changed how families spend their leisure time

### Housework time declined significantly between 1965 and 1975

Average housework minutes per day, UK Time use surveys

- The decline in housework time was seen mainly among non-employed and part-time working women
- Men’s housework time increased slightly from the mid-1970s
- Around one in ten children (12%) report doing no housework, with most (69%) doing up to three hours per week

Source: (1) Bowden and Offer 1994 (2) Gershuny and Jones 1987 (3) DCSF National Survey of Parents and Children 2008
Family remains an important source of fulfilment and people are committed to caring for family. The majority of people make a lot of effort to spend time with family.

With which group of people do you tend to be most happy?1

- Family 73%
- Friends 17%
- Self 6%
- Work colleagues 2%
- Don’t know 2%

60% of people make a lot of effort to spend time with their partner or family, while only 31% and 24% make the same effort to spend time with their friends or to follow their hobbies2

People express a strong preference to do some care for family

- 53% of non-working mothers said they did not take up work because they wanted to be with their children3
- Half of mothers who are not working would like to if alternative family care or affordable, high-quality childcare was available4
- For small children, fathers are the most popular care alternative to mothers; followed by grandparents5,6
- Most grandparents enjoy caring for children7, but half of them feel more stressed4
- Most people would want to and would be able to care for their parents8
- People caring for family or friends report that fulfilment is a key element of the carer experience9

Men and women have become more accepting of egalitarian family arrangements, women more so than men. Men’s attitudes are more traditional when small children are present in the family.

The traditional male breadwinner/female carer family model is increasingly rejected
Percentage who agree with statement “A man’s job is to earn money; a woman’s job is to look after the home and family”

Attitudes remain more conservative when it comes to mothers of pre-school children
Percentage who agree with statement “A pre-school child is likely to suffer if his or her mother works”

- Women hold significantly more egalitarian gender role attitudes than men and there is no sign that this difference is narrowing
- However, in 2005 only 39% of fathers saw breadwinning as the main aspect of what being a father means for them

Segmentation analysis can reveal attitudinal and behavioural differences between groups sharing otherwise similar socioeconomic characteristics. For example, DCSF’s parent segmentation describes two broadly similar groups, one of which is significantly less likely to sacrifice family time in order to get ahead at work

Sources: (1) NatCen 2008 British Social Attitudes: The 24th report (2) EOC 2005 Dads and their babies (3) DCSF National Survey of Parents and Children 2008
Fathers today express great interest in being involved in caring for their children but still believe mothers are better carers. Paternity leave, working flexitime and home working have proved very popular.

Most fathers want to be more involved in childcare but still feel women are generally better carers

<table>
<thead>
<tr>
<th>Percentage of fathers with children aged 3 -15 months who agree¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>79% would feel comfortable caring for their child on their own¹</td>
</tr>
<tr>
<td>However 65% feel women are better than men at caring for children¹</td>
</tr>
<tr>
<td>DCSF segmentation analysis found that 81% of parents agreed that if money wasn’t an issue it would be better for one parent to stay at home at least some of the time²</td>
</tr>
</tbody>
</table>

Fathers show great interest in paternity leave and some other policies to balance work and family life

<table>
<thead>
<tr>
<th>Percentage of fathers reporting availability/take-up³</th>
</tr>
</thead>
<tbody>
<tr>
<td>Since April 2003 fathers have been entitled to two weeks’ paternity leave, which 53% regard as too short³</td>
</tr>
<tr>
<td>In 2005, 36% of fathers took more than 2 weeks off around birth of their child, up from 22% in 2002³</td>
</tr>
<tr>
<td>Over 80% would have liked to take paternity leave, low pay is the main reason for those who did not³</td>
</tr>
<tr>
<td>Fathers’ take-up of flexitime increased from 11% in 2002 to 31% in 2005. Fathers’ working from home doubled from 14 to 29%³</td>
</tr>
</tbody>
</table>

Sources: (1) EOC 2005 Dads and their babies (2) DCSF National Survey of Parents and Children 2008 (3) DWP 2006 Maternity and paternity rights and benefits
Availability of formal childcare and leave policies for parents has increased and creating more choice and opportunities for work-life balance

**Mothers’ average maternity leave duration increased between 2002 and 2005**
Percentage of mothers taking maternity leave of different durations

- Statutory maternity leave and pay was extended in 2003 and 2007 and is among the longest in Europe
- In 2005, mothers took on average 6 months maternity leave compared to 4 months in 2002
- Many mothers returning to the labour market chose to work part-time and downshift

**Take-up of formal childcare has increased, while use of informal childcare is relatively stable**
Percentage of mothers taking up formal and informal childcare, 1999-2007

- Due to increases in female employment, the amount of childcare hours used has probably risen even more than take-up rates
- The number of registered childcare places more than doubled between 1997 and 2008

Sources: (1) DWP 2006 Maternity and paternity rights and benefits (2) Ofsted Quarterly Childcare Statistics
An increasing number of people also work flexibly and enjoy the benefits of a work-life balance, however challenges remain for some families. There is still unmet demand for arrangements.

There has been an increase in employers offering flexible working
% of employers offering flexible working¹

<table>

- 90% of workplaces in 2006 were offering one or more forms of flexible working (85% in 2003)². 91% of workplaces who received requests approved them all². In 2006, 14m people worked flexibly (56% of employees) or have done so within the last year².
- 71% of fathers and 68% of mothers say their family does not have their preferred working arrangement. 22% and 11% respectively are worried about the impact working flexibly could have on their career³.

Unmet demand is focused on alternative forms of flexible working other than PT working
Employees' access to and take up of flexible working²

- The main reason employees give for working flexibly are to improve work-life balance and spend more time with family².
- Part-time arrangements are disproportionately concentrated in lower skilled jobs⁴,⁵ and mainly filled by women with family responsibilities⁶. Half of women in PT jobs are working below their skill level⁷.
- Men prefer flextime working, a compressed work week or working from home⁸.

Sources: (1) 2004 Workplace Employment Relations Survey (WERS) (2) Third Work Life Balance Employees’ Survey (3) EHRC, Mumsnet and DadsInfo 2008 (4) Manning and Petrongolo 2008 (5) EOC Brain Drain (6) ONS 2005 (7) Darton and Hurrell 2005 (8) EOC 2005 Dads and their babies
An increasing number of people would consider using relationship counselling. Mediation in cases of separation or divorce continues to be used only by a minority of couples.

While only 8% of people have used RELATE counselling, many would if they needed help. Percentage responding\(^1\)

<table>
<thead>
<tr>
<th>Method</th>

8. Implications
9. A Modern Family Policy
By family circumstances we mean the material, physical and emotional wellbeing of the family and the individuals within it.
### Summary of changes in family circumstances

**Facts**

- Overall prosperity has increased, though some families still face challenging material circumstances.
- Physical wellbeing is generally improving - we are living longer, but quality of life is not increasing at the same pace, which places increasing burdens on some families.
- Despite overall increases in wealth and health, life satisfaction has remained constant – but where emotional wellbeing is poor, the consequences for other family members are considerable.

**Drivers**

- Different aspects of family circumstances are closely associated with each other – for example, material strain is associated with poor physical and emotional wellbeing.
- Certain family forms are associated with better circumstances, but causality operates in both directions.
- Policy is a key driver of the circumstances families face.
Family wealth has increased, driven by a rise in the number of two-earner families. The proportion of family income spent on leisure has more than doubled in the last twenty years.

Household income has doubled in real terms over the last few decades
Increase in real household disposable income per head, 1971 = 100

More of this wealth is spent on leisure services, though housing remains the biggest outgoing
Difference in household expenditure as a percentage of total expenditure, 1984 versus 2006

Sources: (1) ONS Social Trends 38 (2) GHS - ONS Social Focus on Men (3) ONS Family Spending 2006
However, not all families have benefited equally from prosperity, and some, despite recent progress, face significant challenges.

**Household income inequality grew during the 1980s and then stabilised at a higher level of inequality**

Distribution of real disposable household income

- Workless households roughly quadrupled from 4.0% in 1968 to 17.4% in 1996. There were 3.06 million workless households in the three months to June 2008. This represented 15.8 per cent of all working age households.
- However, since 2000, income inequality and poverty have fallen faster in the UK than any other OECD country.

**The risk of poverty has fallen for families with children, but many families remain in poverty**

Risk of poverty (<60% contemporary median income, before housing costs)

- Since 1997 the number of children living in relative low income has been reduced by 600,000 (before housing costs).
- The proportion of households with less than half of the national median income in the UK is below the OECD average for the first time since the 1980s.
- However, 2.9m children (before housing costs) remain in relative poverty in the UK.

Sources: (1) ONS Social Trends 38 (2) Dickens, Gregg, Wadsworth 2000 (3) ONS Labour Force Survey 2008 (4) OECD Growing Unequal? 2008 (5) HBAI 2006/07
The relationship between poverty, poor housing and a range of poor outcomes is evidence that vulnerable families face the most challenging circumstances.

A falling but significant number of children live in non-decent homes

Percentage of ‘vulnerable’ and ‘non-vulnerable’ households with children (0-15 all tenures) in non-decent homes, 1996 to 2005\(^1\):\(^2\)

- The housing conditions ‘gap’ between vulnerable families (across all tenures) and the more affluent has more than halved (from 17ppts to 8)\(^2\).
- However, vulnerable families are more likely to experience poor conditions than more affluent peers: 29% compared to 20% in terms of non decent homes; 22% compared to 16% in poor quality environments; 14% compared to 4% in overcrowded housing\(^3\).

Social housing persists between generations even when controlling for many variables

Probability of ever being in social housing in adulthood (age 23+) if in social housing at any time in childhood (0-16)\(^4\)

- Poor quality housing (particularly over-crowding) can have an adverse effect on children’s psychological well-being\(^5\). Exposure to ‘adverse housing conditions’ in childhood increases the likelihood of certain illnesses in later life, even if they live in good quality housing in adulthood\(^6\).
- However, there is no robust quantification of the overall impacts of poor housing because of the complexity of both cause and effects.

\(^1\) CLG 2007  \(^2\) CLG EHCS 2005 N.B. ‘vulnerable’ families are in receipt of means tested or disability related benefits Social Trends 38 / CLG (3) CLG mix of published/unpublished research (4) Feinstein 2008 (5) SCIE 2005 (6) Marsh et al. 1999. Note: (a) Control variables categories: Distal - socioeconomic & demographic factors; Proximal - elements of the home environment; Cognitive and Affective - (respective) development; School - features of school group & peer type.
In general health is improving. People are living longer than ever. However, healthy life expectancy is not keeping pace, and providing informal care is a significant issue for many families.

Life expectancy has increased, but healthy life expectancy is not keeping pace
Life expectancy and healthy life expectancy in years England 1981-2001

- Carers report considerable benefits of caring - 80% of care givers can identify at least one positive aspect of care-giving
- However, caring intensively (20 hours+ a week) can have negative consequences for health and employment prospects

A significant proportion of carers have other family responsibilities
% of carers by family status

- Around a third of (working age) carers also have dependent children – these carers face additional burdens
- Equality is an issue as women are more likely to provide care. 11% of women compared to 9% of men are carers (of whom, 33% and 30% care over 20 hours a week respectively)

Sources: (1) ONS (2) Cohen 2002 (3) FRS 05/06 DWP 2007 (4) Uni of York 2000 (5) ONS Census 2001
The social context formed by the family is thought to be an important – in some cases the most important factor – for certain health outcomes.

Obesity has increased in prevalence and family influences are important
Prevalence of obesity, adults aged 16 and over

- 23% of the UK population is now obese, a threefold increase since 1980. In 1995, 11% of boys and 12% of girls were obese, but by 2005 this had risen to 18% for both boys and girls.
- Having an overweight parent has been identified as the strongest risk factor for childhood obesity; evidence continues to suggest that the early life environment can determine later risk of obesity.

The exclusion of the poorest families is reflected in increased death rates from injury in childhood
Deaths from injury and poisoning and rates per year per 100 000 children aged 0-15 years by eight class NS-SEC, 2001-34

- Data from the 1970 birth cohort show that hyperactivity and conduct disorder, and to a lesser extent anxiety, increase with decreasing social class.
- Progress is being made - the 2004–2006 infant mortality rate for routine and manual groups is the same as the rate for the whole population in 1997–1999.

The overall increases in prosperity and physical health, do not appear to have had significant effects on overall life satisfaction. This might be because we adjust to most circumstances, good and bad.

**Life satisfaction has shown only minor changes over 30 years**

Are you satisfied with life? % answering ‘Very’ or ‘Fairly’ Great Britain¹

- In 2006, 85 per cent of people responded to a Eurobarometer survey saying they were satisfied on the whole with the life they led²

---

**Life satisfaction tends to anticipate and adapt to key life events – male unemployment is one exception**

Effect on Life Satisfaction, Fixed Effect ‘Within’ Regressions³

However emotional wellbeing and physical wellbeing are closely related, and the consequences for those in a family where an individual suffers poor emotional wellbeing are considerable.

**Poor mental health is one of the key causes of lost working days**

Working days lost owing to depression in 1999-2000\(^1\)

- In 2000, non-employment was higher by nearly a fifth among working-age adults with any type of mental disorder than those without (39% versus 33%)\(^2\)
- Poor mental health significantly increases the risk of poor physical health and premature death – risks of heart disease are estimated to be twice as high for people with depression or mental illness, and 1.5 times higher for those who are generally unhappy\(^3\)

**The children of depressed parents constitute a high risk group for psychiatric and medical problems**

Summary of associations throughout lifecourse\(^4\)

- Higher levels of maternal depression are associated with adverse outcomes in infancy and early childhood such as language and cognitive deficits and behavioural problems\(^5\)

---

The following slides discuss the drivers of these trends in family circumstances.

What are the factors that influence family circumstances?

- How is material wellbeing interrelated with emotional distress and ill health?
- How does family composition restrict available resources to produce poor circumstances?
- What impact can policy have on families’ circumstances?
Family circumstances create conditions in which families thrive or struggle, and have knock-on effects for other outcomes – for example, material strain is associated with poor physical and emotional wellbeing.

Evidence suggests that obesity remains highest in the lower socio-economic groups.

Obesity among adults(%) by sex and NS-SeC°, 2001¹

- Higher managerial and professional
- Lower managerial and professional
- Intermediate
- Small employers and own account workers
- Lower supervisory and technical
- Semi-routine
- Routine
- Never worked and long-term unemployed
- All

Neurotic disorders are associated with socio-economic adversity.

Weekly prevalence of neurotic disorders: by sex, 2000²

- Rates per 1,000 adults

- Panic disorder
- OCD
- Phobia
- Depressive episode
- Generalised anxiety disorder
- Mixed anxiety and depressive disorder

- Those with neurotic disorders are more likely to be living alone, acting as single parents, separated or divorced, and less likely to be married or cohabiting²
- Greater socio-economic adversity probably explains many of these associations²

- Families with children, particularly lone parents, were more at risk of low income than childless counterparts
- 39% of lone parent families had a gross weekly income of £200 or less; this compares with 7% of married and 9% of cohabiting couple families
- Children living in a family headed by someone from an ethnic minority were more likely to live in low-income households
- Working-age adults living in families with at least one disabled adult or child were more likely to live in low-income households
- Over half of individuals in low-income households lived in families reporting no savings
Having a partner is important for health
Relative risk of limiting long-standing illness by family type (with partner and no children = 1), Age group 20–64\(^1\) (* indicates not statistically significant)

- Almost half (47%) of lone mothers smoked, compared with one-fifth (21%) of mothers in couple families\(^2\)
- Lone parents working for 16 hours or more a week were twice as likely to drink alcohol at least three times a week compared with lone parents working less than 16 hours or not in work (22% and 9%, respectively)\(^2\)

Of couples with children, married couples report higher life satisfaction
% rating life satisfaction 7 or above (1-10 where 10 is highest satisfaction)\(^3\)

- Problems in the immediate neighbourhood, such as vandalism, graffiti and other deliberate damage to property or vehicles, were reported more frequently by lone parent families than couple families (25% compared with 14%)\(^2\)

Sources: (1) ONS Focus on Families 2007; (2) 2004 FACS DWP 2006; note the term ‘mother’ is used to refer to the main respondent in this report (3) Millennium Cohort Study A User’s Guide to Initial Findings July 2007
However the direction of causality is not as straightforward as might appear. International evidence shows that family circumstances can deter or precipitate changes in family composition and vice versa.

In the US, financial concerns affect people’s decision to marry
% mentioning each obstacle to marriage US (n = 47)

- The Millennium Cohort Study found a strong link between partnership status and poverty. Married parents were least likely to be in poverty (14.5% of respondents). 30.4% of cohabiting respondents were in poverty.

In the UK, parents who both work are less likely to break up
Odds ratios of breakdown, UK BHPS 92-95

- There is a higher risk of couples splitting when they are hit by economic shocks such as unemployment.
- Divorce risks for spouses with little formal education and in manual worker occupations were found to be specific to marriages of relatively short duration.
- In contrast, such factors as unemployment, wife’s high income, and living in a rented dwelling were found to increase divorce risk at all marital durations.

Policy is a key driver of family circumstances. Supporting families facing difficult circumstances – whatever their form – will have positive implications for other outcomes.

Every family experiences a drop in income when parents break up – policy can reduce the impact

Median percentage change in net income by wives with 1+ kids experiencing marital split, BHPS wave t (91-97) to wave t+1 (98-03)\(^1\)

- Analysis suggests this has most likely due to the increased lone parent employment rate associated with the introduction of Working Families Tax Credits\(^1\)
- US studies show the sudden drop in income experienced by most lone-parent families after break up is the single most important factor explaining underachievement of young people\(^2\)

Family-based treatments for weight problems have been shown to be effective

Decreases in the percentage of those who were overweight over 10 years\(^3\)

- The four most common health problems related to obesity are high blood pressure, coronary heart disease, type 2 diabetes, and certain cancers\(^4\)
- Many people are not in employment as a direct result of obesity, either on health grounds or for other reasons, including, possibly, discrimination in the workforce\(^5\)

7 The Future for Families
8 Implications
9 A Modern Family Policy
This chapter discusses the potential future challenges for families.

This section will:

1. Discuss predictions of Britain’s demographic profile in the coming decades
   - Past and current fertility and life expectancy trends will result in an ageing population

2. Consider whether family pluralism is likely to continue given past changes in behaviour and attitudes
   - While changes in social norms and values relating to family and gender roles may have slowed down, they are unlikely to reverse
   - The plurality in family form is hence likely to continue
   - Forecasts of an increasing male/female sex ratio favour more egalitarian gender roles

3. Reflect on new choices of families, and possible future legal and moral questions families and the Government are likely to face
   - Declining marriage rates raise questions about alternative legal regulation of long-term relationships
   - Technology will offer more choice in terms of family formation and increase life expectancy raising new moral questions for families
   - Increased individualism raises questions about future redistribution of the provision of family functions from families to markets or Government or within families from women to men
   - Several other drivers that are difficult to predict are likely to shape family life
Britain’s past demographic profile will result in a growing proportion of elderly people. This will have implications for public services and the role of family in society.

The number of pensioners will grow more rapidly than those of working age
Index, 2006 = 100

- By 2031 the UK’s population will have grown by 6.5 million—of which 85% will be over 65
- Of the estimated 5.5m Britons living abroad around 17.5% are there for retirement
- Married couples are significantly more likely to emigrate than non-married
- There should continue to be adequate numbers of carers in terms of demographics and willingness

It is therefore predicted the ratio between pensioners and workers that will increase
Dependents per 1,000 workers

- The future population is likely to be more ethnically diverse
- The proportions of older people likely to be married will grow substantially due to the marriage boom of the 1970s and increased life expectancy of men
- It is estimated about a third of those aged 35-65 in 2031 will have no co-resident partner

The total fertility rate is unlikely to decline to very low, unsustainable levels. However, a lower proportion of the population will be under 20

The fertility rate is likely to remain stable while life expectancy will increase further
Average no. of children per women (left axis), Life expectancy at birth in years (right axis)¹

- Overall fertility levels are predicted to be just below replacement rate¹
- Differences in fertility levels between population groups are unlikely to narrow unless preferences shift dramatically or combining work and family becomes easier²
- The increase in life expectancy is predicted to continue¹

A lower proportion of the population will be under 20
Projections, index of number of children (left), per cent of children (right)³

- By 2050 the average man will live to 89 whilst women on average will live into their early 90s³
- A lower proportion of the population will be under 20 affecting the age structure of society³. This will have implications for the ability to raise taxes to pay for an ageing society

Sources: (1) Population Trends 131 (2) Smith and Ratcliffe 2007 (3) ONS GAD 2006 based principal population projections
Trends towards gender equality and plurality in family forms may slow down but are unlikely to reverse. More single-person households will have implications for public services.

The sex ratio is predicted to increase, especially among age groups of family formation.

2006-based projections of ratio of males to females, England, 2006-31

- Due to the narrowing gender gap in life expectancy, the sex ratio (male/female) of people at childbearing age is predicted to increase to 1.05.
- Evidence suggests this will increase gender equality bargaining power within households.
- Simultaneously, the trend towards more egalitarian gender role expectations is unlikely to reverse.

Single and co-habiting households are on the increase.

Household estimates and projections: (millions) England, 2001-29

- The number of cohabiting couples, estimated to be 2 million in 2003, is projected to rise to 3.8 million by 2031 (90% increase in 25 years).
- The number of households in the UK will rise from 24 to 30 million by 2021, of which over a third will be single person households. This will have implications for public services such as housing.

Sources: (1) ESRC Changing Household and family structures and complex living arrangements 2006 (2) GAD projections 2008 among those aged 20-34 (3) Pedersen 1991, Secord 1993 (4) Crompton and Lyonette 2008 BSA (5) ONS GAD 2006 based principal population projections
Other countries have responded to greater pluralism in family forms with alternative legal arrangements

Most British people think cohabitants should have the same rights as married couples
Percentage who agree or disagree¹

- Fathers’ right to consent to child’s medical treatment
- Women’s right to financial support after separation
- Right to family home after partner’s death

</tr>
</tbody>
</table>

Some countries have introduced legal alternatives to marriage or different marriage contracts

- For heterosexual couples, currently marriage is the only option to obtain legal safeguards for the case of separation or death of one partner except for making a written agreement on specific issues
- The Scottish Family Law Act 2006 has given cohabitants similar rights but this option lacks conscious decisions to enter into a contract by either partner²,³
- In some countries marriage contracts offer a choice between different rules for dividing up property⁶
- Many countries recognise prenuptial agreements, which are similar but only apply to the specific issue addressed⁷
- Some countries have introduced different civil partnership agreements for same sex and heterosexual couples

Technology has created new opportunities for families e.g. through IVF and increased life expectancy, but has also created new ethical dilemmas.

Fertility treatments have become commonplace; the next step may be human genetic engineering
Percentage saying should / should not be allowed

Consistently high numbers think doctors should be allowed to end patients’ life at their request
Percentage who agree or disagree, BSA, 1981-2001

- In Vitro Fertilisations (IVF) and Donor Inseminations have increased, 32,000 IVF treatments gave rise to 11,000 children in 2004
- In the future, human genetic engineering will raise difficult questions for families
- The majority of British people believe that genetic engineering will probably be allowed to stop heart diseases or violence but not to choose a child’s sex or sexual orientation

The trends towards greater individualism may increase the demand for Government or private and voluntary sector provision of family functions. The future mix of provision is however highly uncertain.

The cultural ideal of marriage has become more individualised

Proportions of popular articles on marriage emphasising themes of self-development and independence, percent

- Increasing levels of individualism can be observed in terms of:
  - Higher expectations of love, independence and self-development in relationships
  - Women’s reduced willingness to forgo earnings for informal care in a world of high family instability

- These changes may increase the demand for Government or market provision of family functions

A different balance of provision by families, Government and the private and voluntary sector are possible

- More functions are provided by the Government (e.g. LA care). Could imply higher Government spending

- More functions are provided by the private & voluntary sector either purchased by families or commissioned by government. Implies possible equity issues and/or higher Government spending

- Same or more functions are provided by the family. Probably will require some rebalancing of gender roles. Still implies considerable role for others to support this transition and strengthen families’ capabilities

Several other drivers are likely to impact on family life in the future. However most of these are highly uncertain and difficult to predict.

6  Family Circumstances
7  The Future for Families
8  Implications
9  A Modern Family Policy
Changes in family life in Britain are interesting in their own right. But Government is mainly concerned with the impact they have on vulnerable family members and on wider society

Summary of evidence presented in this chapter¹:

- Increased pluralism of family structures need not lead to poorer outcomes, since evidence suggests that the quality of relationships and families’ circumstances have a greater effect on outcomes than the legal structure
- Poorer outcomes of lone-parent families are often connected to consequences of relationship breakdown and time constraints rather than the family form. For step-families, children’s relationship with the new partner seems to be a key driver of outcomes
- Parental conflict and loss of income after separation results in negative outcomes for families
- Women’s financial independence and changing gender role expectations regarding the division of domestic labour increase choice but also provide challenges to family stability. Communication and commitment seem to be key to coping with differences in expectations.
- Parents’ responsiveness and the quality of the home learning environment are key to children’s behavioural and cognitive outcomes
- Poor material circumstances, emotional distress, and ill health reinforce material and other disadvantages for children and adults. This effect is partly indirect through poorer adult and child-parent relationships

Notes: (1) These implications are discussed in a wider context in:
- Foresight (2008) Mental Capital and Wellbeing project
Marriage is associated with successful outcomes. However, evidence on causation is weak

<table>
<thead>
<tr>
<th>A</th>
<th>Marriage is associated with successful outcomes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Married couples tend to have higher incomes(^1), lower risk of poverty and accumulate more wealth(^2)</td>
<td></td>
</tr>
<tr>
<td>2. They are happier, less prone to depression and suicide and live longer(^2)</td>
<td></td>
</tr>
<tr>
<td>3. Cohabiting couples are more likely to separate than married couples.(^{12}) US data suggests they are also less satisfied with their relationship, even after they make the transition to marriage(^{13})</td>
<td></td>
</tr>
<tr>
<td>4. Children living with cohabiting biological parents had more behavioural and emotional problems and lower school engagement than those in married households(^3)</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>B</th>
<th>Certain characteristics are associated with higher probabilities to marry</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Male partners’ earnings, occupation, or education are positively associated with the transition to marriage(^4)</td>
<td></td>
</tr>
<tr>
<td>2. Low income seems to be a major reason for long-term cohabitation rather than marriage in the UK and the US(^5)</td>
<td></td>
</tr>
<tr>
<td>3. Other reasons include regarding relationships as a personal rather than a public commitment(^6)</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>C</th>
<th>But other relationship types seem equally able to match these effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. The reasons given by many academics(^7) for the better outcomes of marriage include:</td>
<td></td>
</tr>
<tr>
<td>2. social expectations, security and expectations of long-term stability</td>
<td></td>
</tr>
<tr>
<td>3. promotion of extra efforts on behalf of partners to improve the relationship (and the absence of factors that weaken it)</td>
<td></td>
</tr>
<tr>
<td>4. However, it is also the case that people with more money, better relationships, more commitment, higher education and better mental wellbeing are more likely to get married, and these variables may be central to these better outcomes:</td>
<td></td>
</tr>
<tr>
<td>5. studies that control for variables such as income, wealth, attitudes, education and relationship duration show a much smaller effect(^8,9). One study of Norway demonstrated a virtual elimination of the effect(^10)</td>
<td></td>
</tr>
<tr>
<td>6. But capturing all relevant variables is difficult. For example the level of commitment is rarely observed and therefore not taken into consideration in studies. The evidence is ambiguous whether this can explain the remaining effect.</td>
<td></td>
</tr>
<tr>
<td>7. Generally, evidence suggests that the quality of relationships matters most regardless of the legal form(^11)</td>
<td></td>
</tr>
</tbody>
</table>

Lone-parent families experience more problems than two-parent families. However, this is mainly driven by problems around the relationship breakdown, and the financial consequences.

### Impact

<table>
<thead>
<tr>
<th>A</th>
<th>Lone parenthood is associated with less successful outcomes</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Children of single-parent families do less well at school&lt;sup&gt;1&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• 25% of families with children are lone parents; 71% of families in the lowest income decile&lt;sup&gt;1&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• 62% of lone parents are poor compared to 16% of two-parent families&lt;sup&gt;1&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• 35% of single mothers in the MCS* showed signs of depression compared to 23% of partnered mothers&lt;sup&gt;2&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• 70% of young offenders are from lone-parent families&lt;sup&gt;2&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• Adolescents in the US who lived apart from one parent at some time, were twice as likely to drop out of high school&lt;sup&gt;3&lt;/sup&gt;</td>
<td></td>
</tr>
</tbody>
</table>

### Composition

<table>
<thead>
<tr>
<th>B</th>
<th>Lone parents face more difficulties in fulfilling the full range of roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>• By definition lone parent families are cut off from some family functions</td>
<td></td>
</tr>
<tr>
<td>• They are often disadvantaged in finding the time for breadwinning and caring and have to rely more heavily on extended family members</td>
<td></td>
</tr>
<tr>
<td>• Mothers and fathers have different roles and relationships in the family – an absent parent can be associated with adverse material and emotional outcomes&lt;sup&gt;4,5&lt;/sup&gt;</td>
<td></td>
</tr>
</tbody>
</table>

### Processes

<table>
<thead>
<tr>
<th>C</th>
<th>Lone parents can encounter problems that reduce the potential to maximise outcomes of families</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Lone parent families are formed in many ways—the most common is separation or divorce&lt;sup&gt;6&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• The drop in income and the deterioration in parenting resources experienced by most lone-parent families after break up are the most important factors explaining poorer cognitive and emotional outcomes of children&lt;sup&gt;3&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• Good relationships with both parents can have a separate positive effect on children’s outcomes through the qualitative different roles that mothers and fathers have with their children&lt;sup&gt;4,5&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• Irrespective of custody arrangements, where a mother and father cooperate over parenting children adjust more easily to divorce&lt;sup&gt;6&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• Research comparing intact families experiencing high conflict with lone parents found children fared less well in intact families&lt;sup&gt;7&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• Recently, a small but growing number lone mothers are single from the start by choice. This group is likely to suffer fewer negative psychological risks from break-up&lt;sup&gt;6&lt;/sup&gt;</td>
<td></td>
</tr>
<tr>
<td>• The evidence therefore suggests that it is not being a lone parent itself that is problematic but rather the relationship problems that led to breakdown and the financial consequences that often follow</td>
<td></td>
</tr>
</tbody>
</table>

Step-families face greater challenges as a result of the consequences of relationship breakdown and the presence of a new partner

**A Stepfamilies are associated with less successful outcomes than biological two-parent families**

- Children in stepfamilies show more psychological and behavioural problems than children in biological two-parent families\(^1\)
- Their outcomes are similar to those growing up in lone parent families\(^2\)
- Remarriage is associated with substantial recovery of the financial position faced by women and their children following an earlier marriage dissolution\(^3\)

**B Stepfamilies face particular challenges due to their family history and composition**

- Children in stepfamilies have experienced their parents’ relationship breakdown and are faced with a new step-parent
- While stepfamilies face fewer time constraints in breadwinning and caring than lone parents, the presence of a step parent often creates challenges for the relationships between family members

**C Step-families can encounter problems that reduce the potential to maximise outcomes of families**

- US studies found girls were much happier when their mother remained unmarried, because of difficult relationships with new step-fathers\(^4\)
- Older children find it harder to adapt than younger children and often display disruptive and demanding behaviour characterised by hostility and resentment towards a step-father\(^5\); there are some indications that girls get on better with their step-mothers as time goes on\(^6\)
- The British Avon study found children’s psychological problems associated with step-families had more to do with their circumstances (e.g. depressed mother, poor relationships with mother and father and economic hardship\(^7\)) rather than the family composition
- However, a follow up of this study found parents were more affectionate towards their biological children\(^8\)
- The evidence therefore seems to support the view that the negative outcomes are more due to the lasting impact of experiencing relationship breakdown and difficult relationships with a new family member

Healthy family stability and good relationships between partners result in positive outcomes for families. In some cases separation is the best solution for families in conflict.

**A** Relationship breakdown is associated with various child and adult outcomes

- Divorced individuals have poorer physical and emotional well-being compared to the married\(^1\)
- However rates of suicide and domestic violence are higher within marriage than those who divorced\(^1\)
- Parental separation is associated with a range of adverse childhood, adolescent and adult outcomes for children e.g. in terms of cognitive development, education and labour market disadvantages\(^2\)
- 75% of couples experiencing high levels of conflict choose not to separate\(^3\)

**B** Relationship breakdown is often accompanied by conflict, financial and emotional loss

- The drop in income after relationship breakdown is usually larger for women than for men\(^4\); however men also experience negative employment effects\(^5\)
- Conflict resolution and regulation predict longitudinal outcomes in relationships\(^6\)
- Stable economic, emotional and physical circumstances also contribute to relationship quality before and after separation\(^7\)

**C** There are numerous negative effects of separation – most seem the result of conflict and financial consequences

- Although conflict may be part of family life, intense parental conflict has been identified as a key mediating variable in reducing parenting quality and producing negative outcomes for children, including those in intact families\(^8\)
- Commitment, communication skills, ability to solve conflicts and intimacy and emotional support are therefore key factors for relationship quality and stability\(^8\)
- Amicable relationships between parents are reported to reduce negative outcomes of divorce on children\(^9\)
- The drop in income experienced by most lone-parent families after break up explains a lot of the adverse consequences for young people\(^10\)
- British women’s incomes recover on average after three years albeit not to the previous level\(^5\)
- Women’s life satisfaction on average recovers more quickly than men’s\(^11\)
- The evidence suggests that healthy relationship stability rather than family type has a causal effect on positive parenting and better outcomes for children\(^12,9\) Most of the negative effects of family breakdown on children however seems due to worsening financial circumstances and problems in the relationship between children and parents

Women’s financial independence and changing gender role expectations regarding the division of domestic labour provide challenges as well as opportunities for family

**A** Changing gender roles are associated with relationship and parenting quality

- Women’s employment is associated with higher family incomes but greater instability
- 88% of single women are looking for gender equality in a relationship compared to only 76% of men; 45% of women however still want their partner to assume a protecting role
- More highly educated parents are more likely to be authoritative and positively responsive in their parenting style
- The more educated fathers are, the more likely they are to read to their children regularly

**B** Women’s work and care choices are interrelated with expectations and family circumstances

- Women’s and men’s relationship expectations influence their partner choice but there is often a gap between expectations and actual division of labour
- Families’ circumstances e.g. material and emotional stress are important mediators of the effect couples’ division of labour has on outcomes for children and either parent

**C** The effects of the division of labour on outcomes depend on expectations and a combination of pressures

- Women’s financial independence through employment increases their ability to leave an unhappy relationship, which should have positive effects on women’s material and emotional wellbeing
- The positive effect of women’s employment and resulting financial independence on divorce risk is not significant for women who hold egalitarian gender role attitudes, suggesting that for these women employment may at the same time have a positive effect on relationship quality
- Most studies find no or only a weak negative effect of mothers’ employment on children’s development, which is more than offset by positive effects of family wealth
- Lack of help with domestic work from husbands is associated with higher risk of maternal distress after birth
- Perceptions of unfairness in the division of domestic work lower women’s relationship satisfaction and wellbeing
- Long work hours and overload can reduce relationship and parenting quality for men and women
- Although selection effects are difficult to fully account for, the evidence suggests that the division of labour is causally related to outcomes of families but the direction of the effect depends on women’s expectations and on the resulting total workload for both partners

Parents’ responsiveness and the quality of the home learning environment are key to children’s behavioural and cognitive outcomes

### Parenting quality and child outcomes

- Children whose parents are predictably responsive to their needs form more secure attachments.
- Secure attachment increases the likelihood of positive peer interaction and good behavioural outcomes in preschool and early school years.
- More parental time spent on stimulating child-centred activities is associated with better behavioural and cognitive outcomes for children.

### Parenting quality seems interrelated with relationship quality, education, and working hours

- Good relationship quality between mother and father are positively associated with the warmth of the parent-child relationship.
- More educated parents spend more time playing and reading to their children and are more positively responsive in their parenting style.
- Fathers with long work hours and in professional occupations are found to spend less time on childcare.

### The effect of parental time on child outcomes is mediated by a variety of factors

- There is evidence that very little parental time with children may reduce children’s wellbeing but there is little evidence that more time is always better.
- How parents interact with their children (parenting style) and the quality of parental time seems more important for child development than reduced time through mothers’ employment.
- Positive responsive parenting style facilitates a secure attachment which makes positive behavioural outcomes for children more likely.
- Child temperament is likely to account for some of the variation in parenting style but there is probably an independent causal effect.
- Parents’ time spent with children on playing, reading or homework has a positive effect on children’s behavioural and school outcomes.
- Poor economic circumstances and stress can lead to a less responsive parenting style and less child-centred activities and hence probably account for part of the socio-economic differences in child outcomes.
- While there are exceptions, generally early childhood attachment is a strong predictor of adolescent behaviours and later education and labour market outcomes.

Poor material circumstances are transmitted across generations, and are associated with other disadvantages. This effect is partly indirect through poorer spousal and child-parent relationships.

A

Material disadvantage is associated with a range of poor outcomes for adults and children

- Patterns of intra- and intergenerational transmission of poverty persist: people who experience poverty at some point are more likely also to be poor in the future and so are their children.
- Depression is widely agreed to be affected by socioeconomic disadvantage: Children from the lowest social classes, especially from families where no parent has ever worked, are most likely to have a mental disorder.

B

Material circumstances are interconnected with family composition and family processes

- Families with children, particularly lone parent families, are more at risk of low income than their childless counterparts.
- Economic disadvantage is associated with relationship instability; with more coercive parenting; and less parent-child shared activities that enhance child development.

C

The effect of parental time on child outcomes is mediated by a variety of factors

- There is some evidence for a direct impact of material factors on adult and child outcomes - unemployment and poor housing contribute to negative physical and mental health; child obesity rates in disadvantaged areas may be linked to lack of quality recreation facilities.
- Despite methodological concerns in establishing causation, the impact of family circumstances on child outcomes is principally mediated through relationships between partners and parenting. Disadvantaged circumstances especially men’s low earnings have a negative impact on relationship stability.
- Economic factors also affect family functioning. Economic deprivation leads to higher rates of depression in mothers which is associated with less responsive parenting. Male unemployment is associated with domestic violence.
- Families’ low income seems to lead to poorer behavioural and cognitive outcomes for children, through inability to invest in time and buy goods and services for children and through increased stress and coercive parenting styles.
- Evidence shows that increasing family incomes alone can have a positive effect on child outcomes, e.g. on educational attainment.

Emotional distress and ill health also directly and indirectly affect child and adult outcomes. Again family processes are an important mediator. Both are closely interrelated with material deprivation.

### Physical and emotional health are associated with a variety of outcomes

- Working-age adults living in families with at least one disabled adult or child are more likely to live in low-income households.
- Some family circumstances drive and reinforce each other i.e. disability and neurotic disorders are associated with material disadvantages.
- Parental obesity is associated with a higher risk of obesity among children.

### Emotional wellbeing is also associated with the quality of family processes

- Emotionally distressed adults are less likely to have highly satisfying relationships with their partner and tend to be less positive and responsive in their parenting styles.
- Evidence suggests that the early life environment can determine later risk of obesity.

### Emotional wellbeing drives outcomes of families, partly through its influence on family processes

- There is some evidence for a direct impact of emotional distress and poor physical health on adults’ material outcomes (i.e. through greater likelihood of unemployment) and on child wellbeing (i.e. through genetic inheritance).
- However part of the effect is likely to work through partner relationships and parenting.
- High levels of depressive symptoms at marriage are linked to low marriage quality; increases in depression are accompanied by decreases in marriage quality.
- Causality is difficult to establish, as lower initial marriage quality also predicts greater subsequent depression.
- Maternal depression diminishes children’s wellbeing, partly as a result of less nurturing and less engaged parenting (more use of harsher disciplinary practices, less time reading). This has been linked with greater behavioural problems of children such as aggression and acting out, withdrawal and anxiety.

In summary, family processes and family circumstances matter most for outcomes. But certain family forms face more challenges.

Family circumstances provide the right conditions for effective family processes. Certain circumstances are also outcomes (e.g. poverty) and have direct effects on other outcomes (e.g. emotional wellbeing).

Family functions
What families can do

Family composition

Family circumstances

Family process

Outcomes of families
What families achieves

Certain families e.g. lone parents do not have access to all family functions (e.g. adult companionship)

Quality of relationships and family life matter most for outcomes of families, more so than family composition.
And there are complex interdependencies between the three factors

Impact

Summary
For example, parental separation is a life event that negatively affects families. However, it is not separation itself that has a negative effect but the way it affects family processes and circumstances.

1 Parental separation …

2 … is a change in family composition

3 But it is the resultant drop in income for a single parent and in some cases the upheaval of changing home or school …

4 … together with conflict and poorer parenting and sometimes the loss of contact with one parent …

5 … which accounts for most of children’s adverse outcomes

The aim of this section is to articulate Government’s role in supporting families, in light of the evidence presented

This section will:

**Why**
- Set out why Government has a role in supporting families
  - Explore how issues in families’ decisions in terms of lack of information, insufficient consideration of effects on society and inequity can elucidate the role of Government

**When**
- Identify when Government should support families
  - Not all families require the same level of support at all times
  - But Government can help families to continuously build strong and healthy relationships
  - Individuals in families have rights and responsibilities towards each other, but in difficult circumstances, Government can provide support to families through challenging times

**How**
- Explore how Government can most effectively support families
  - Government works best in partnership with families, and the private and voluntary sector
  - Government can help families to develop the right capabilities and reduce pressures
  - A number of principles can be derived from the evidence to inform policy development
  - Examples of policies focussing on pressures and capabilities around childbirth and during the early years are used to illustrate the application of the four policy principles

It is beyond the scope of this paper to evaluate existing or new family policies. Reference to certain policies will be made by way of illustration, but the main focus is to provide a framework to think about family policy. It does not discuss issues of policy implementation, which are covered elsewhere e.g. Think Family Report. (1)

(1) www.cabinetoffice.gov.uk/social_exclusion_task_force/families_at_risk.aspx
Economic concepts of market failure can be used to elucidate the case for Government support and involvement in family life, in pursuit of the best outcomes for children, adults, the community and society.

</tbody>
</table>

### Externalities
- Outcomes of families have positive or negative effects on wider society:

  - Good parenting reduces crime and promotes the productivity of the next generation
  - Family care provision reduces fiscal costs of old age care
  - Some parents may be unable to provide their children with a safe and nurturing home to maximise their life chances

### Information
- Information on how to achieve good family outcomes is insufficiently available:

  - Parents seeking advice on parenting skills
  - People underestimate the long-term happiness from healthy relationships and under-invest in the short-term
  - Families underestimate the impact of stress points such as childbirth

### Equity
- Families differ in their resources and abilities from the start and children do not choose their parents:

  - Children in low income families find it harder to succeed in education
  - Disabled children may face discrimination
  - Persistent gender pay gaps constrain women’s (and men’s) choices

Identifying these factors does not in itself justify intervention – the available levers must also be assessed.
Life-events can pose particular challenges for families – even if they are generally desired such as the birth of a child. Government has a range of tailored policies to support families at these points.

### Examples of life-events and support to families:

<table>

Possible support:
- Relationship advice & skills
- Legal rights & responsibilities
- Financial advice
- Pre-natal classes
- Parenting advice and support
- Childcare
- Legal support
- Financial rights for children of separated parents
- Counselling services
- Health care and emotional support
- Respite for carers
- Protection against income loss
- Job search support and advice
- Financial benefits in relation to childcare costs
- Skills and training

The extent of government support and intervention at each life event responds to family needs.
But for a given life-event, public services should respond according to families’ abilities to fulfil their responsibilities, alongside family need.

Generally families are best placed to deal with life events, should be the first port of call, and have the responsibility to do so. But some families find it easier than others.

Government support can help families to change trajectories and/or reduce need.

Government support is not confined to particular life events and responds to changing family needs throughout the life cycle.

At certain life events, need rises for all families.

Stylised life events:
- Birth of child
- Divorce / Separation
- Ill health

Note: (1) This figure is only for illustrative purposes and cannot be used to compare family needs at different life events.
Most family functions can not only be provided by families. In reality, the provision of family functions is more diverse with Government working in partnership with families and others.

For example:
- Parents provide a home learning environment for transmitting social and cultural capital
- Families care for children, and for sick or elderly family members and friends

For example:
- Provides education in schools
- Supports families’ income and provides insurance through the benefit system
- Helps families in balancing work and care

While many family functions can be fulfilled by state or market, substitution is limited for some functions such as companionship.

For example:
- Provides education in schools e.g. childcare and elderly care
- Provides insurance in case of unfortunate life events
- Enables family-friendly working practice

The degree of partnership should be informed by efficiency considerations and differ for social groups or policy areas.

Note: (1) For illustration only.
To make the most of the partnership, Government’s role is twofold: reduce families’ pressures and enhance their capabilities. In most policy areas both approaches are taken.

### Reduce pressures
- Rights & legal protection
- Financial support
- Support in kind
- Access to maternity and paternity leave reduce families’ time pressures after birth
- Flexible working and childcare help parents to balance work and care
- Targeted benefits such as childcare tax credits support families that experience the greatest financial strain

### Enhance capabilities
- Information & guidance
- Skills & training
- Intervention
- Before and after birth, universal health visitors provide information and training for women and their children
- Parenting initiatives provide support for parents to promote child development and healthy relationships between partners
- Family Intervention Programmes provide targeted training for families at greatest risk and disadvantage

**Example: child birth**
The evidence in this paper suggests that a modern family policy should be informed by a number of guiding principles, against which policy options that reduce pressures and enhance capabilities are tested.

Policies that seek to reduce pressures and enhance capabilities must be informed by the evidence presented earlier in this paper about what matters for outcomes.

The following policy principles are intended to distil the evidence into a form that can guide future policy development across government institutions.

These principles are complementary and there are often trade-offs between them.

Examples of existing policies are given to illustrate the application of the principles.

Government policy should …

1. empower families to achieve their potential
2. be proportionate
3. support families regardless of form or structure
4. be socially equitable

Each of these principles will be discussed in more detail in the following slides.
Principle one – a modern family policy empowers

The evidence suggests …

- Family is a unique institution in terms of its ability to provide a wide range of functions
- Family as an institution has a remarkable ability to adapt to changing circumstances
- Families are best placed to make decisions according to their individual circumstances in an increasingly diverse society

… Government should therefore

- Provide families with information so they can make informed decisions
- Support a fair balance of entitlements and responsibilities
- Raise families’ aspirations to achieve their full potential

The Parenting Early Intervention Programme aims to increase support for the parents of 8-13 years olds at risk of negative outcomes (particularly anti-social behaviour) and help them to improve their parenting skills.
Principle two – a modern family policy is proportionate

The evidence suggests …

- Family has benefits and costs for its members but also wider society
- Therefore family has responsibility not only to its members but also to wider society

… Government should therefore

- Work in a partnership with families based on fair rules: respecting privacy but expecting, and in some cases enforcing, families to fulfil their responsibilities too
- Intervene if the well-being of vulnerable family members especially children or the community is at risk

65 Family Intervention Projects are currently working with around 2000 families a year to improve the lives of families involved in persistent anti-social behaviour
Principle three – a modern family policy should not exclude families based on form or structure

The evidence suggests …

- All family forms can achieve good outcomes though some family forms face more challenges
- However, there is strong evidence that what matters most is the quality of relationships

... Government should therefore

- Provide support not on the basis of family form or structure
- Ensure good life chances for all children regardless of their family form

The Government’s introduction of civil partnerships means that same sex couples now have access to many of the state and private pension rights enjoyed by married couples

Notes: (1) Segmentation analysis can inform policy development in line with this principle – see DCSF Survey of Parents and Children: Family Life, Aspirations and Engagement with Learning 2008
Principle four – a modern family policy ensures equal opportunities

The evidence suggests …

• Certain families are more likely to face multiple disadvantage e.g. parents of disabled children

• Material disadvantage is often interdependent with emotional distress; both increase the risk of relationship breakdown

• Experiencing disadvantage in childhood affects children’s outcomes as adults, and these, in turn, affect their children, thus creating inter-generational cycles of disadvantage

… Government should therefore

• Provide universal support for every family

• Target those in genuine need more to help create equal opportunities – material and legal – to achieve their full potential and improve social mobility

Government’s determination to tackling child poverty is clear, and the commitment to eradicate child poverty by 2020 will be enshrined in law. Support is target at those in particular need.
However, tensions can arise between different policy aims. The policy principles are instructive for identifying the trade-offs involved in policy-making.

For example, tensions may arise between policy principles …

3. support families regardless of form or structure
   - Evidence: All families irrespective of family form experience particular pressure after childbirth in terms of care burden and financial strain.
   - Policy implication: Maternity and paternity leave rights and child benefit should not discriminate against any family form.

4. be socially equitable
   - Evidence: Lone parents have by definition less resources to provide and care for their children and may need extra support.
   - Policy implication: Fair rules suggest that while families have responsibilities to help themselves, Government also has a role to play in providing equitable life chances e.g. through financial support.

Options will have to be weighed up.
These policy principles are the foundations of a modern family policy. Using the example of childbirth and early years, we illustrate how the policy principles can be applied to guide and inform policy options.

This pack sets out the Government’s family narrative that will inform forthcoming Government publication

Next steps.....

- The aim of this analytical discussion paper is to raise awareness of the importance of the family, and the issues the family faces in the 21st century

- The paper provides a foundation for taking forward a discourse on how best to promote the family in the 21st century

- The Government has indicated that this discussion will be taken further through a number of subsequent steps:
  - **Children’s Plan One Year On** – published in December 2008
  - **Relationship summit** – on 18 December 2008
  - **Social Mobility White Paper** – to be published in January 2009
