

2011 Census Analysis: Do the Demographic and Socio-Economic Characteristics of those Living Alone in England and Wales Differ from the General Population?

Coverage: **England and Wales**

Date: **17 December 2014**

Geographical Areas: **Country, Local Authority, Local Authority and County, Region**

Theme: **Population**

Theme: **People and Places**

Foreword

This story analyses the characteristics of those living alone within the household population aged 16 and over, and the broader usually resident population, using data from the 2011 Census. Characteristics analysed include age and sex, housing tenure, qualifications and ethnicity. Geographical variations in those living alone are also highlighted.

Key Points

- The proportion of the total usually resident population of all ages living alone in England and Wales in 2011 (13%) was similar to the overall proportion living alone within the European Economic Area (EEA) (14%).
- Of the household population aged 16 and over in England and Wales in 2011, 16% (7.1 million) were living alone.
- The proportion living alone increased gradually with age: from less than 4% for ages 16 to 24, to 17% for those aged 50 to 64 and 59% for those aged 85 and over.
- 26% of the household population aged 16 and over with no qualifications were living alone in 2011; 14% of those with a degree level or above qualification were living alone.
- More than half (54%) of those living alone owned their own home (including 36% who owned outright).
- The majority (72%) of those living alone were living in properties with two or more bedrooms.

- Of the total usually resident population aged 16 and over, Black/African/Caribbean/Black British ethnic groups had the highest levels living alone in 2011 (17%), while Asian/Asian British ethnic groups were the least likely to live alone (7%).

Introduction

In 2011, 13% (7.1 million) of the total usually resident household¹ population of England and Wales were living alone. This proportion was the same as in 2001, when 13% (6.5 million) of the total usually resident household population were living alone (see Table 1). Of the household population aged 16 and over² in England and Wales in 2011, 16% (7.1 million) were living alone³.

Table 1: Usual residents and household population of England and Wales; 2001 and 2011

	2001 Census (millions)	2011 Census (millions)	% change 2001-11
Usually resident population (those in households and communal establishments)	52.0	56.1	7.8
Persons in households	51.1	55.1	7.6
Persons in households aged 16 and over	40.7	44.5	9.5
One person households	6.5	7.1	8.7

The proportion of the total usually resident population¹ living alone in England and Wales (13%)⁴ was similar to the overall proportion for the [European Economic Area \(EEA\)](#) countries in 2011 (14%) (see Figure 1), and similar to the proportions in Latvia, Iceland and Italy (all 13%). Within Europe, proportions living alone ranged from 7% in Bulgaria to 24% in Denmark; these differences may be linked to varying cultural and social attitudes across Europe.

Figure 1: European comparison of percentage of the population living alone, 2011

Previous analysis of 2011 Census data has summarised changes in [households and household composition](#) between 2001 and 2011. This analysis focuses on the characteristics of those living alone compared to the usually resident population as a whole. The following characteristics are considered in this short story and are based on the household population (excluding those living in communal establishments (1.0 million)):

- Age and sex
- Geographical differences
- Household tenure
- Household spaces
- Qualifications

Additionally, ethnicity is also considered but is based on the total usually resident population aged 16 and over.

Information on those living alone may be used by a variety of people, including:

- MPs and policy makers.
- Those planning and delivering services. For example, information about people living alone can be used to help produce projections of the number of households.
- Researchers, academics and journalists analysing societal changes in the way we are living.
- Businesses including the building industry.

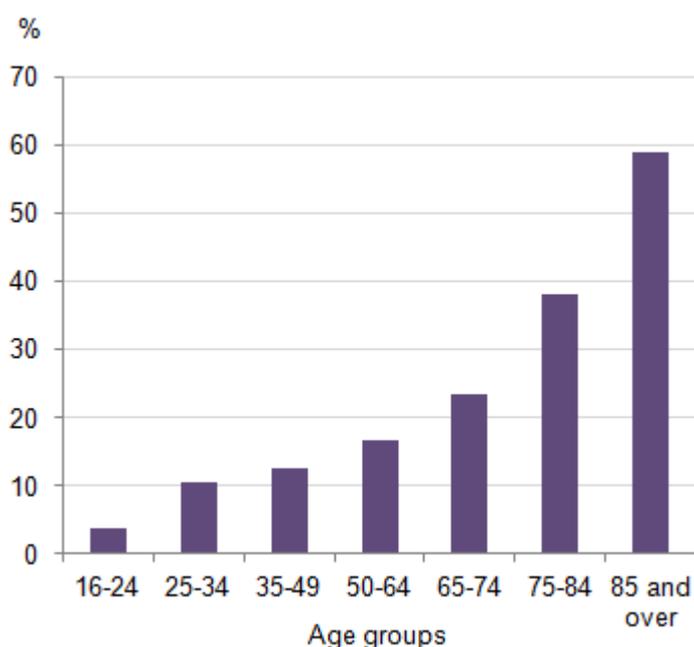

Notes for introduction

1. The usually resident population refers to people who live in the UK for 12 months or more, including those who have been resident for less than 12 months but intend to stay for a total period of 12 months or more. In 2011, the usually resident population of England and Wales was 56.1 million; the household population was 55.1 million. The difference between the two was the 1.0 million living in communal establishments.
2. The total household population aged 16 and over in England and Wales recorded in the 2011 Census was 44.5 million; the total usually resident population aged 16 and over was 45.5 million. The difference between the two was accounted for by the communal establishment population aged 16 and over (1.0 million); there were a total of 38,000 people aged under 16 in communal establishments in 2011.
3. Comparisons of one person households aged 16 and over in 2011 with equivalent data for 2001 are not possible as data for one person households in 2001 was available for all persons only irrespective of age (it included those aged under 16).
4. ONS house style is to present percentages to one decimal place when under 10%, but rounded to the nearest whole number when above 10%.

Age and sex analysis

Age and sex analysis of those living alone is based on the household population aged 16 and over (7.1 million); this excludes a total of 822 people aged under 16 who were living alone in 2011. For those aged 16 and over, the proportion living alone increased gradually with age: from less than 4% for ages 16 to 24 to 17% for those aged 50 to 64 and 59% for those aged 85 and over (Figure 2).

(28 Kb)

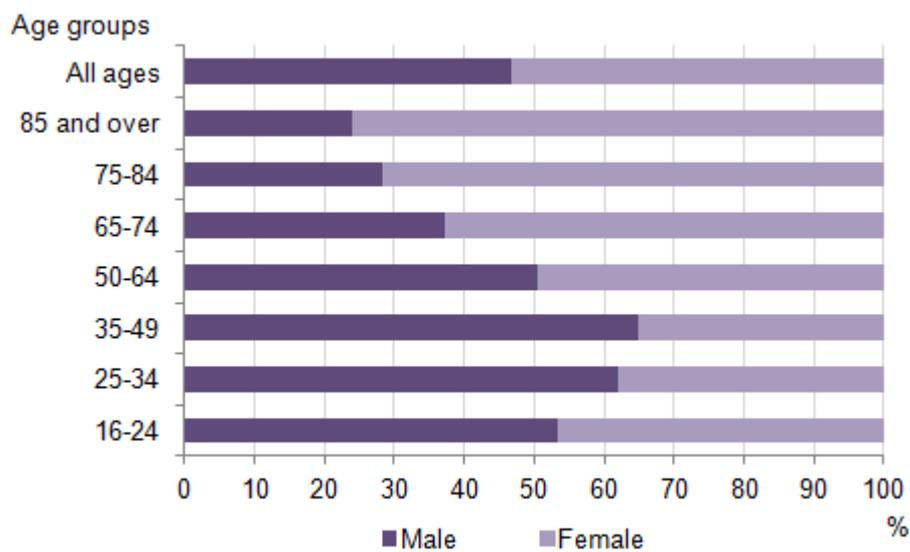

Overall, there were 88 men for every 100 women living alone in 2011 in the usually resident household population aged 16 and over; this varied from 184 men for every 100 women aged 35 to 49, to 59 men for every 100 women aged 65 to 74 and 32 men for every 100 women aged 85 and over.

Figure 3 shows that there were more men than women living alone in age groups under 65, with the highest proportion of men living alone found in the age group 35 to 49 (65%). This may be partly the result of divorced men in this age group being less likely to be living with their children than divorced women. Those aged 65 and over living alone were more likely to be women (69%), with

the percentage increasing from 63% in the 65 to 74 age group to 76% in the age group 85 and over. This reversal at older ages is likely to relate mainly to the longer life expectancy of women compared with men.

A previous [ONS publication](#) identified 150,000 men and 474,000 women aged 85 and over living alone; 69% of all women aged 85 and over living in private households were living alone compared with 41% of men.

Geographical differences in living alone

The five local authorities with the highest proportions of the usually resident household population aged 16 and over living alone are shown in Table 2. Four were London boroughs, with more than one in three residents of City of London aged 16 and over living alone and more than one in four residents of Kensington and Chelsea living alone.

In contrast, a number of London boroughs had very low proportions living alone: the lowest proportion was 10%¹ in Harrow. Outside London, Hart (Hampshire) had 11% living alone. Differences may relate to complex variations in the demographic profile of these areas, including age, sex, ethnicity, availability of suitable housing and marital status; Hart had a high proportion

of married persons identified in a previous [ONS publication](#), while Harrow had a low proportion of [divorced people](#).

The local authority with the highest proportion of the population living alone within Wales was Gwynedd (19%), ranked 22nd within England and Wales; Merthyr Tydfil had the lowest proportion living alone (14%), ranked 275th within England and Wales.

Table 2: Five local authorities with the highest and lowest proportions of the usually resident household population aged 16 and over living alone in England and Wales, 2011

Ranked highest	Local authority	%	Ranked lowest	Local authority	%
1	City of London	37.5	1	Harrow	10.0
2	Kensington and Chelsea	27.8	2	Hart	11.2
3	Westminster	26.5	3	Newham	11.2
4	Camden	22.3	4	Surrey Heath	11.6
5	Hastings	22.0	5	Wokingham	11.7

[Map 1 data](#)

The five local authorities with the highest proportions of the usually resident household population aged 50 and over living alone were all London boroughs (Table 3). Almost half (46%) of residents aged 50 and over in City of London were living alone in 2011, the highest proportion of any

local authority in England and Wales. While this is a relatively high proportion it may not reflect relationship status: City of London also had a high proportion of usual residents with second addresses elsewhere; this suggests that some of the residents living alone may actually have had families elsewhere, and lived with those families for some of the time.

Table 3: Five local authorities with the highest and lowest proportions of the household population aged 50 and over living alone in England and Wales, 2011

Ranked highest	Local authority	%	Ranked lowest	Local authority	%
1	City of London	46.4	1	Hart	17.5
2	Westminster	38.8	2	Harrow	18.1
3	Kensington and Chelsea	37.1	3	Surrey Heath	18.2
4	Islington	36.8	4	Wokingham	18.2
5	Camden	36.6	5	South Northamptonshire	18.5

[XLS](#) [XLS format](#)
(28.5 Kb)

The proportions of usual residents aged 50 and over living alone in the household population were generally higher in the North West, West Yorkshire, Greater Manchester, London and Wales (Map 2). By contrast, Hart (Hampshire) had the lowest proportion of those aged 50 and over living alone (18%) (Table 3); this may relate to high levels of [life expectancy](#) in the South East which may allow couples to remain living together longer. Map 2 shows that proportions of those aged 50 and over living alone were generally lower in the Midlands and the East of England, though they were high in the coastal regions of South East and East England.

Notes

1. ONS house style is to present percentages to one decimal place when under 10%, but rounded to the nearest whole number when above 10%.

Household tenure

Household tenure analysis is based on the total household population of all ages living alone (7.1 million). Over half (54%) of those living alone in 2011 owned their own property (including 36% who owned their home outright) (Figure 4). This may relate to the age profile of those living alone as older residents are more likely to have purchased property and paid off their mortgages; 59% of those aged 65 and over living alone owned their home outright compared to 19% of those aged under 65 living alone.

Figure 4: Comparison of tenure distribution for one person households and all households, 2011

Download chart

[XLS](#) [XLS format](#)
(28.5 Kb)

In 2011, 30% of all households in England and Wales were one person households (Figure 5); the proportion was lower among owner occupied households, with one in four (26%) being one person households. Within the owner occupied category there were variations: a higher proportion

of households that were owned outright (35%) or had shared ownership (39%) were one person households, while a lower proportion of those owned with a mortgage (17%) were one person households. More than two in five (43%) of social rented households were one person households, while more than half (52%) of those living rent free were one person households.

Download chart

[XLS](#) [XLS format](#)
(28 Kb)

The overall proportion of owner occupied households that were one person households varied from 55% in City of London to 19% in Uttlesford (Essex); the low proportion in this affluent part of Essex may be a result of older people moving away to other areas after selling high value property, and the presence of Stansted Airport in the area as a major employer.

The proportion of households owned outright that were one person households varied across England and Wales: from 59% in Trafford to 28% in Cheshire West and Chester.

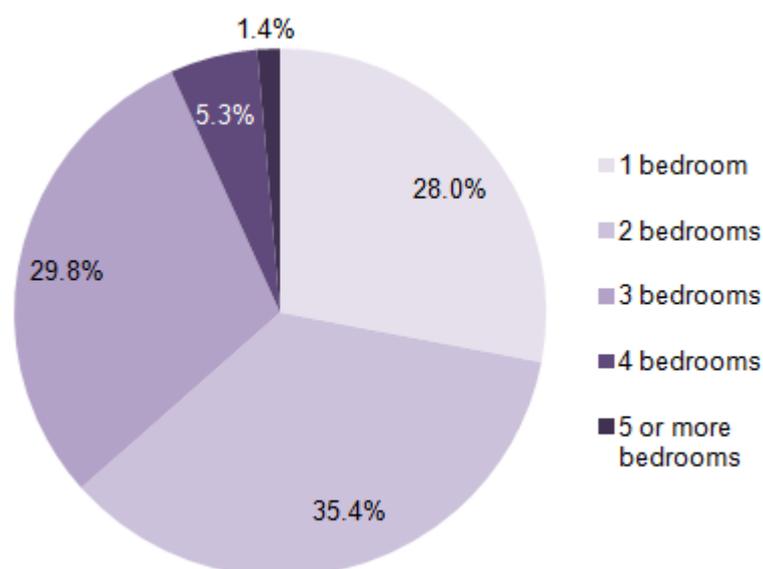

Household spaces

There were 23.4 million occupied household spaces¹ in 2011; of these, 30% (7.1 million) were one person households. Of those living alone in 2011, only 28% lived in one bedroom properties. The remaining 72% of people living alone were living in household spaces with two or more bedrooms (35% were living in two bedroom properties, 30% in three bedroom properties and 6.7%² living in properties with four or more bedrooms), and were therefore living in under-occupied³ properties

(Figure 6). The proportion under-occupied was slightly higher than the total proportion of households found to be under-occupied (69%) in an earlier 2011 [Census analysis](#).

However, not all of those living alone may necessarily be living alone all the time: there may be parents whose non-resident children stay with them some of the time, lone parents with non-dependent children who live with them outside term-time and people who 'live apart together'. In some of these cases, people may require extra bedrooms for some of the time.

[XLS](#) [XLS format](#)

(28 Kb)

The majority (72%) of one bedroom households were occupied by one person (Figure 7). The proportion of one person households declined with increasing numbers of bedrooms; however 39% of two bedroom properties and more than one in five (22%) three bedroom properties were occupied by people living alone. Even among households with five or more bedrooms, almost one in ten had only one occupant.

Notes

1. Household space is the accommodation used or available for use by an individual household, at the defined address. Occupied household spaces are those occupied by usual resident (households). In 2011 there were 24.4 million household spaces; 96% (23.4 million) of these were occupied, the remaining 4.4% (1.1 million) were not occupied by usual residents. Household spaces with no usual residents may still be used by short-term residents, visitors who were present on census night or a combination of short-term residents and visitors. Vacant household spaces and those that are used only as second addresses are also classified in census results as household spaces with no usual residents.
2. ONS house style is to present percentages to one decimal place when under 10%, but rounded to the nearest whole number when above 10%.
3. For each household, ONS derived a bedroom occupancy rating by subtracting the notional number of bedrooms recommended by the bedroom standard from the number of bedrooms actually available. An occupancy rating could indicate overcrowding or under-occupation within a household as follows:

- Occupancy rating of 0: implies that a household has the precise notional number of bedrooms recommended by the bedroom standard, for the number and composition of people living within the household.
- Occupancy rating of -1 or less: indicates that a household has at least one bedroom too few for the number and composition of people living in the household and is considered overcrowded by the bedroom standard.
- Occupancy rating of +1: indicates that a household has one bedroom more than is recommended for the number and composition of people living in the household and is considered under-occupied by the bedroom standard.
- Occupancy rating of +2 or more: indicates that a household has two or more bedrooms more than is recommended for the number and composition of people living in the household and is also considered under-occupied.

The Housing (Overcrowding) Bill of 2003 defines the bedroom standard as: “(4) For the purposes of the bedroom standard a separate bedroom shall be allocated to the following persons:

(a) A person living together with another as husband and wife (whether that other person is of the same sex or the opposite sex)

(b) A person aged 21 years or more

(c) Two persons of the same sex aged 10 years to 20 years

(d) Two persons (whether of the same sex or not) aged less than 10 years

(e) Two persons of the same sex where one person is aged between 10 years and 20 years and the other is aged less than 10 years

(f) Any person aged under 21 years in any case where he or she cannot be paired with another occupier of the dwelling so as to fall within (c), (d) or (e) above.”

Please note that while the 2011 Census uses the bedroom standard definition stated above, the Housing Bill of 2003 also takes account of uninhabitable bedrooms and rooms with less than 50ft² floor space in determining bedrooms or rooms available to a household. The census does not collect this information and it is therefore not used in deriving the 2011 Census bedroom occupancy ratings.

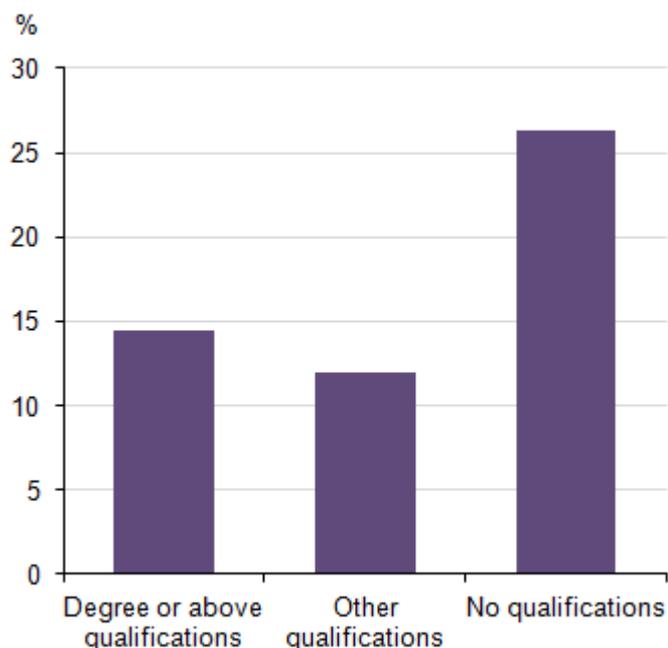

Please note also that households with one bedroom include those which indicated having no bedrooms in their census responses.

Qualifications

Highest qualification analysis is based on the usually resident household population aged 16 and over. In 2011, 26% of the population aged 16 and over with no qualifications were living alone, while the equivalent proportion for those with a degree level or above qualification was 14% (Figure 8).

The proportion of people living alone with different qualification levels varied geographically: while 38% of residents with a degree level qualification or above in City of London were living alone, only 9% of those similarly qualified in Harrow were living alone.

Figure 8: Proportion of the population aged 16 and over living alone by highest qualification level, 2011

Source: Census - Office for National Statistics

Notes:

1. Data from Census table DC5103EW via Nomis.
2. 'Other' qualifications include apprenticeships, vocational qualifications, foreign qualifications for which the UK equivalent is not known and those qualified to level 1, 2 or 3 (secondary and tertiary education).

Download chart

[XLS](#) [XLS format](#)

(28.5 Kb)

Ethnicity

Ethnicity analysis is based on the total usually resident population aged 16 and over (45.5 million).

A person's ethnic group refers to their own perceived [cultural background](#). The proportion of the population aged 16 and over¹ living alone [varied by ethnic group](#) in 2011.

Table 4 shows the proportion of the population aged 16 and over in 2011 living alone by broad ethnic group. Of these, Black/African/Caribbean/Black British ethnic groups had the highest level living alone (17%); however, this group accounted for only 3.3% (232,000) of all those aged 16 and over living alone. White ethnic groups were living alone slightly less frequently (16%), but accounted for the majority (91% or 6.5 million) of all those living alone. Among these broad ethnic groups, Asian/

Asian British ethnic groups were living alone least commonly in 2011 (6.6% or 209,000); this may be partly a result of varying attitudes towards living arrangements in different cultures as identified in previous research on [concealed families](#). The age profile of different ethnic groups may also have an effect, as older residents are more likely to live alone.

Table 4: Proportion of usual residents aged 16 and over living alone by broad ethnic group, 2011

Ethnic group	% living alone
White	16.2
Mixed/multiple	15.8
Asian/Asian British	6.6
Black/African/Caribbean/Black British	17.1
Other	14.6
All ethnic groups living alone in usually resident population	15.5

(27 Kb)

Figure 9 shows a more detailed breakdown of those living alone by ethnic group. Among the white ethnic groups, those of Irish origin were living alone most frequently, with almost one in four (24%) residents living alone; this was the highest proportion of any ethnic group. The median age of [Irish-born](#) in England and Wales in 2011 was 61.7 years. Among the white ethnic groups, those of 'other white origin' were living alone least frequently (11%); this included those Eastern European migrants with a younger age profile (for example the median age of [Polish-born](#) was 30.1 in 2011). Those of Caribbean ethnicity showed similar proportions living alone (23%) to those of Irish ethnicity; this may also relate to the [age profile of Caribbean residents](#) (for example, the median age of [Jamaican-born](#) was 55.3 in 2011).

Within the Asian/British Asian group, proportions living alone varied. Those of Chinese ethnicity were most likely to live alone (11%)², while those of Bangladeshi (3.7%), Pakistani (4.2%) and Indian (6.3%) ethnicity were least likely to live alone. This may relate partly to cultural and economic differences, but may also reflect the age structures of the different groups.

Figure 9: Percentage of the population aged 16 and over living alone by ethnic group, 2011

(28.5 Kb)

Notes

1. Proportions have been calculated using usual residents aged 16 and over as a denominator. The figures for those living alone include a small number of people (822 nationally) living alone who were under the age of 16. This will have a minimal effect on the resulting proportions; however it is possible that the impact could vary between ethnic groups if those aged under 16 living alone were more frequent in some ethnic groups. This was considered to be a more representative measure than the proportion of all usual residents living alone, as almost all residents under the age of 16 were dependent children and not living alone.
2. ONS house style is to present percentages to one decimal place when under 10%, but rounded to the nearest whole number when above 10%.
