About the Office for National Statistics
The Office for National Statistics (ONS) is the government agency responsible for compiling, analysing and disseminating many of the United Kingdom’s economic, social and demographic statistics, including the retail prices index, trade figures and labour market data, as well as the periodic census of the population and health statistics. The Director of ONS is also the National Statistician and the Registrar General for England and Wales, and the agency that administers the registration of births, marriages and deaths there.

Preface

Comparison with the 1997 SIC(92) publication.

This publication does not represent a major revision. Apart from some changes to titles and changes due to the expiry of the ECSC Treaty in July 2002, the main changes are:

- A breakdown of class 29.40 (manufacture of machine tools) into three classes: portable hand-held, metalworking and other.

- A breakdown of class 40.10 (production and distribution of electricity) into three new classes, one for manufacture, one for transmission and one for distribution and trade.

- A breakdown of class 40.20 (manufacture of gas; distribution of gaseous fuels through mains) into one class for manufacture and one for distribution and trade.

- A breakdown into two new classes each of classes 51.64 (wholesale of office machinery and equipment) and 51.65 (wholesale of machinery for use in industry, trade and navigation).

- A new class (74.86) for call centre activities.

- A new class (72.21) for publishing of software.

- A breakdown of class 90.00 (sewage and refuse disposal, sanitation and similar activities) into three classes covering collection and treatment of sewage, collection and treatment of other waste and sanitation, remediation and similar activities.

- In response to user demand for a more detailed coding structure within the UK, the introduction of 41 new five digit subclasses.

For all subclasses, whether new or already available, the balancing or not elsewhere classified subclass is numbered as a /9. For example, 'Manufacture of other containers' is coded as 21.21/9.

In some cases, the creation of new subclasses left the balancing subclass, as previously numbered, in the middle of a list of specific subclasses. Consequently, when the balancing subclass was moved and renumbered as /9 a space was created at the old subclass number. Following the principle adopted in 1997, we continue to leave the old subclass blank and insert the note 'This code is no longer in use.'

The only other significant changes are that the Introduction has been brought up to date and the Methodological Guide, previously a separate publication, is now incorporated into this publication.

No further changes or publications are now envisaged until 2007 when a major revision is expected in line with European Community plans for the future development of its classification system NACE Rev 1.1.

**Introduction**

A Standard Industrial Classification (SIC) was first introduced into the United Kingdom in 1948 for use in classifying business establishments and other statistical units by the type of economic activity in which they are engaged. The classification provides a framework for the collection, tabulation, presentation and analysis of data and its use promotes uniformity. In addition, it can be used for administrative purposes and by non-government bodies as a convenient way of classifying industrial activities into a common structure.

**Classification changes**

Since 1948, the classification has been revised in 1958, 1968, 1980, 1992 and 1997. Revision is necessary because, over a period of time, new products and new industries emerge and shifts of emphasis occur in existing industries. It is not always possible for the system to accommodate such developments and after a period of time updating the classification is the most sensible action. The 1997 changes were not a full-scale revision but a response to user demand for a limited number of additional subclasses together with some minor renumbering. Similarly, this publication is a further minor revision of SIC(92) reflecting contemporaneous changes in NACE Rev.1 (see next paragraph) and meeting UK user demand for additional detail at the subclass level.

The need for change equally affects all international classifications and they are revised from time to time to bring them up to date. On 9 October 1990 the European Council of Ministers passed a regulation to introduce a new statistical classification of economic activities in the European Communities (NACE Rev 1). In January 2003, a minor revision of NACE Rev 1, NACE Rev.1.1, was published.\(^1\)

**International classifications**

From the outset, the UK SIC followed the same broad principles as the relevant international systems. UK statisticians played an important part in the formulation of the first ISIC (International Standard Industrial Classification of All Economic Activities), issued by the United Nations in 1948 and revised in 1958, 1968, 1989 and now in 2003. Nevertheless, there were differences in detail between the two as ISIC reflected the structure of economic activity in the world as a whole rather than that in one particular country.

In 1980, one of the principal objectives of the revision of the SIC was to examine and eliminate differences from the activity classification issued by the Statistical Office of the European Communities (Eurostat) and entitled *Nomenclature générale des activités économiques dans les Communautés européennes*, usually abbreviated to NACE. This 1970 NACE could be rearranged to agree with ISIC at aggregated levels but departed from it in the details. The 1980 revision of the SIC applied NACE as closely as was practicable to the structure of British industry.

In 1990, however, the first revision of NACE was made by EC regulation and this presented a different set of circumstances.

**EC Regulation**

A European Community regulation is directly applicable in all member states. It does not have to be confirmed by national parliaments in order to have binding effect. The NACE regulation, therefore, made it obligatory on the UK to introduce a new *Standard Industrial Classification, SIC(92)*, based on NACE Rev 1, and to use it where the UK is required to transmit to the European Commission statistics on economic activity.

The NACE regulation gives effect to the wish of Eurostat to establish a common statistical classification of economic activities in order to promote comparability between national and Community classifications and, therefore, between national and Community statistics. The regulation applies to the use of NACE for statistical purposes only, although a country can also use NACE for administrative purposes. The regulation does not oblige Member States to collect, publish or supply data. NACE is only a language and all requests for data collection, transmission and publication must be specified elsewhere. As noted already, there is now a new version of NACE, NACE Rev. 1.1, which came into effect in January 2003.

As already indicated, NACE was originally an acronym but now all countries use “NACE” to describe the European Community classification of Economic Activities.
**UK SIC Structure**

*UK SIC(2003)* is based exactly on NACE Rev. 1.1 but, where it was thought necessary or helpful, a fifth digit has been added to form subclasses of the NACE Rev. 1.1 four digit classes. Thus, *UK SIC(2003)* is a hierarchical five digit system. However, at the first or highest level of aggregation, unlike the SIC(80) which had 10 divisions, *UK SIC(2003)* is divided into 17 sections, each denoted by a single letter from A to Q. Some sections are, in turn, divided into subsections (each denoted by the addition of a second letter). The letters of the sections or subsections can be uniquely defined by the next breakdown, the divisions (denoted by two digits). The divisions are then broken down into groups (3 digits), then into classes (4 digits) and, in several cases, again into subclasses (5 digits). So for example we have:

- **section D**  Manufacturing (comprising divisions 15 to 37)
- **subsection DB**  Manufacture of textiles and textile products (comprising divisions 17 and 18)
- **division 17**  Manufacture of textiles
- **group 17.5**  Manufacture of other textiles
- **class 17.51**  Manufacture of carpets and rugs
- **subclass 17.51/1**  Manufacture of woven carpets and rugs

There are 17 sections, 16 subsections, 62 divisions, 225 groups, 517 classes and 285 subclasses. The full structure of *UK SIC(2003)* is shown on pages 21 to 46.

As with SIC(80), the full number of arithmetically possible subdivisions at each level is not necessarily created, varying according to the diversity of activities. For example, section A (agriculture, hunting and forestry), has no subsections and only two divisions, 01 and 02, whereas section D (manufacturing) is divided into 14 subsections and contains 23 divisions. The use of 0 as the final digit for a group or class normally indicates that it is the only subdivision at that level. Thus division 16 (manufacture of tobacco products) has only one group, 16.0 and only one class, 16.00. On the other hand, division 17 (manufacture of textiles) has 7 groups and so is numbered 17.1 through to 17.7.

**Links to international classifications**

To the four digit level, *UK SIC(2003)* follows NACE Rev. 1.1 exactly. The difference is in the *UK SIC(2003)* subclasses. For example, in both NACE Rev. 1.1 and *UK SIC(2003)*, class 55.10 represents “Hotels and motels”. In *UK SIC(2003)*, however, three subclasses are added so that 55.10/1 is “Hotels and motels, with restaurant (licensed)”, 55.10/2 is “Hotels and motels, with restaurant (unlicensed)” and 55.10/3 is “Hotels and motels, without restaurant”. The first two digits, the divisions, of *UK SIC(2003)* and NACE Rev. 1.1 are exactly the same as in ISIC Rev 3.1 in content and in coding. Beyond this, and shown after a decimal point in the SIC and NACE codes, the three digit groups and the four digit classes can be directly converted to the ISIC headings but may have different code numbers (eg. ISIC class 6519 = SIC/NACE class 65.12) or have to be combined to reach the ISIC heading (eg. ISIC class 6022 = SIC/NACE classes 60.22 + 60.23).

**Change from 1980 SIC**

In addition to the change in the numbering system, there are also some changes in the sequence in which different industries are listed. For example, SIC(80) division 1 (Energy and Water Supply Industries) was split into fuel extraction (section C, Mining and Quarrying); fuel processing and production (section D, Manufacturing) and energy production and distribution (section E, Electricity, Gas and Water Supply). Also of note is section D which encompasses parts of SIC(80) divisions 1 and 2 and all of divisions 3 and 4, thereby being much larger as a section than it initially appears. Not surprisingly, therefore, section D is the most highly divided having 14 subsections of manufacturing. The most marked change from SIC(80) is the increase in headings in the services sector. This can be seen by looking at SIC(80) division 9 “other services” which splits, principally, between eight of the new section headings.

The following table gives a broad comparison between the sections used now and the divisions used in SIC(80), although the correlation is not exact as relatively minor differences in coverage are ignored.

The table cannot show changes within sections. Within section G retail outlets are now classified by type and not, mainly, by goods sold, as they were in SIC(80). A more detailed table of the main changes between the 1980 classification and SIC(92) has been produced by the Office for National Statistics.(2) Re-issuing that correlation to incorporate the new subclasses and the limited re-numbering of subclasses appearing since the original SIC(92) publication was not considered to be justified. It must be stressed that it is not possible automatically to re-code between classifications where activities previously covered by one code are now covered by several.

**Related classifications**

There are other classifications, both national and international, which may be used in conjunction with the industrial classification. These include, for example, the classification of occupations, which relates to the jobs performed by individual workers rather than to the industry in which they work. The workers classified to a particular industry will fall into a number of different categories of an occupational classification and similarly the workers in some occupations may be found in many different industries. The UK uses the Standard Occupational Classification (SOC).(3)

A second classification is by sector. In the UK this is the Sector classification for the National Accounts.(4) The economy is split up into institutional sectors with each economic unit allocated to one of these sectors. The sectors are: General Government, Financial Corporations, Non-financial Corporations, (private and public), Non-profit Institutions serving households and the Rest of the World sector in principle. The classification embraces all economic units engaging in transactions in goods and services, although the number of different types of service will normally be much less than the number of different products of the production industries. Each product (good or service) is, in general, classified to only one industry, that in which it is mainly produced. In practice, many units produce not only the goods or services which are principal products of the industries to which the units are classified but also products mainly produced in other industries.

At the international level, the United Nations has the Provisional Central Product classification (CPC).(5) The main aim of the CPC is to provide a general framework for international comparisons of product statistics. It applies to tradeable and non-tradeable goods and services. The CPC was agreed at the UN Statistical Commission in February 1989. An updated CPC, Version 1.1, was produced by the Voorburg classifications group in 2002. The UN documentation of the CPC provides direct links to the Harmonized System (HS) and the Standard International Trade classification (SITC) described below. The European Community, however, preferred a product classification that was closer to the industrial activity classification and devised the Classification of Products by Activity (CPA).(6) The CPA 2002 relates directly to the classification structure in NACE Rev.1.1, the first four digits are the same, and has links to CPC via the fifth and sixth digit. The CPA, then, provides details of products by economic activity.

The CPA is linked to the PRODCOM list, which extends the CPA code structure from six to eight digits. PRODCOM is from PRODucts of the European COMmunity, and is a list, developed by Eurostat, of around 5000 products for which production data was required from all Member States from 1993.(7) PRODCOM covers only sections C, D and E of the NACE Rev.1.1 classification.

In addition to the product lists associated with industrial activity classifications, there are also Classifications recording imports and exports. The United Nations Standard International Trade Classification (SITC Revision 3) and the Harmonized Commodity Description and Coding System (HS) with which it is correlated have been widely adopted throughout the world as the basis for national classifications both for tariff and trade statistics purposes. The HS was devised by the Customs Co-operation Council to support international trade and to meet the requirements of Customs authorities, statisticians, carriers and producers. The SITC is the most commonly published format for foreign trade statistics. The Member States of the European Community used the more detailed Combined Nomenclature (CN) to collect trade data through their Customs procedures. The CN was developed directly from the HS and was used for the collection of both intra-Community and external trade statistics.
**Use of the UK SIC(2003)**

SIC classifications are determined according to the principal activity of a unit. Ideally, this is based on value added; in practice a proxy, such as turnover or employment, is frequently needed. In general, SIC(80) classification rules on, for example, use of the SIC, statistical units and how to assess the secondary and ancillary activities continue to apply. Detailed guidance is set out in the section on Rules for Classifying Statistical Units.

**UK SIC(2003) Indexes**

As with previous versions of the SIC, there is a separate publication containing detailed lists of products and activities contained in UK SIC(2003). (8)

**Principles used in constructing NACE and followed in SIC (2003)**

**Criteria for divisions and groups**

1. The main criteria employed in delineating divisions and groups (the two and three digit categories, respectively) of NACE concern the characteristics of the activities of the producing units. The major aspects of the activities are:
   - (i) the character of the goods and services produced,
   - (ii) the uses to which the goods and services are put, and
   - (iii) the inputs, the process, and the technology of production.

2. The weights assigned to these criteria vary from one SIC area to another. In a number of instances, for example food manufacturing, the textile, clothing and leather industries, the production of machinery and equipment and the service industries, the criteria are so close that the problem of assigning weights is not significant.

3. In the case of intermediate products, physical composition and the stage of fabrication of the items are often given the greatest weight.

4. In the case of goods with complicated production processes, the end-use, technology and organisation of production of the items are frequently given priority over the physical composition of the goods.

**Criteria for classes**

5. The criteria concerning the manner in which activities are combined in, and allocated among, enterprises are central in the definition of classes (four digit categories). They are intended to ensure that it will be practical most of the time to use the classes of NACE for the industrial classification of kind-of-activity units or enterprises, and that the units falling into each class will be as similar in the kinds of activity in which they engage as is feasible.

6. The classes of NACE are defined so that, as far as possible, the following two conditions are satisfied:
   - (i) the production of the category of goods and services which characterises a given class accounts for the bulk of the output of the units classified to that class, and
   - (ii) the class contains the units which produce most of the category of goods and services which characterise it.

**Kind of ownership**

7. NACE does not draw distinctions according to kind of ownership, type of legal organisation or mode of operation because such criteria do not relate to the characteristics of the activity itself. Units engaged in the same kind of economic activity are classified in the same way, irrespective of whether they are incorporated enterprises, individual proprietors or government, and whether or not the parent enterprise consists of more than one unit.

8. Classifications according to kind of legal ownership, kind of organisation or mode of operation may be constructed independently of the activity classification. Cross-classification with NACE will provide useful extra information.

9. Similarly, manufacturing units are classified according to the principal kind of economic activity in which they engage, whether the work is performed by power-driven machinery or by hand or whether it is done in a factory or in a household. Whether the production process is modern or traditional is not a criterion.

**Market and non-market**

10. In the structure of NACE Rev.1.1 the distinction between market and non-market activities is not a consideration, even though this had been the case in NACE 1970. There are some classes in NACE Rev.1.1 that are normally non-market, for example, certain classes of division 75. There are several others which define both market and non-market activities.
Definitions

Definition of activities

Activity 11. An activity is said to take place when resources such as equipment, labour, manufacturing techniques, information networks or products are combined, leading to the creation of specific goods or services. An activity is characterised by an input of products (goods or services), a production process and an output of products.

12. In practice, the majority of production units perform activities of a mixed character. The identification of a principal activity is necessary to allocate a unit to a particular NACE Rev.1.1 heading.

Principal activity 13. The principal activity is identified by the top-down method (see paragraphs 34–44) ideally based on the value added although other criteria such as employment are often used in practice. The principal activity so identified does not necessarily account for 50% or more of the business' total value added.

Secondary activity 14. A secondary activity is any other activity of the business that produces goods or services.

Ancillary activities 15. Principal and secondary activities are generally carried out with the support of a number of ancillary activities such as accounting, transportation, storage, purchasing, sales promotion, and repair and maintenance. Ancillary activities are those that exist solely to support the main productive activities by providing non-durable goods or services.

16. However, if the activities of the statistical unit and the corresponding ancillary activities, for example, a computing centre, are carried out in different geographical areas, it may be desirable to collect separate information on these units for the categories of data which have to be classified in terms of geographical area.

What is an ancillary activity? 17. An ancillary activity must satisfy the following conditions:

(a) it serves only the unit or units referred to and its goods or services must not be sold on the market;

(b) a comparable activity on a similar scale is performed in similar production units;

(c) it produces services or, in exceptional cases, non-durable goods which do not form part of the unit's end product;

(d) it contributes to the current costs of the unit itself, that is, it does not generate gross fixed capital formation.

What is not an ancillary activity? 18. It should be noted that under the above definition the following are not to be regarded as ancillary activities:

(a) producing goods and services that are part of capital formation. For example, construction work for own account would be separately classified to construction if data were available;

(b) production a significant part of which is sold commercially, even if much of it is consumed in connection with principal activities;

(c) the production of goods which subsequently become an integral part of the output of the principal or secondary activity (for example, production of boxes by a department of an enterprise for packing its products);

(d) the production of energy (an integrated power station or coking plant), even though the whole output is consumed by the parent unit;

(e) the purchase of goods for resale in an unaltered state;

(f) research and development, as this activity does not provide a service that is consumed in the course of current production.
19. In all these cases, where separate data are available for these activities, separate units should be distinguished and they should be recognised as kind-of-activity units and classified according to their principal activity.

**Statistical units**

**Data availability**

20. A wide range of information is required to construct a complete statistical picture of industrial activity, but the organisational level at which it is feasible to assemble the information varies according to the type of data. For example, profits data for a company may be available from only one geographically central location in respect of several different locations, whereas product sales data may be available in respect of each of the separate locations. To observe and analyse the data satisfactorily it is, therefore, necessary to define a family of statistical units. These form the building blocks for the allocation of the appropriate classification in respect of which data can be collected.

**Different types**

21. Different types of statistical units meet different needs, but each unit is a specific entity, which is defined in such a way that it can be recognised and identified and not confused with any other unit. It may be an identifiable legal or physical entity or, as for example in the case of the unit of homogeneous production, a statistical construct.

**International comparability**

22. In order to ensure international comparability the definitions adopted for use within the European Union are linked directly to those given in the introduction to the United Nations International Standard Industrial classification of All Economic Activities (ISIC Rev 3.1) and the United Nations System of National Accounts.

**The units**

23. The following are the units that are described in the Council Regulation on statistical units:

- the enterprise group;
- the enterprise;
- the kind-of-activity unit (KAU);
- the local unit;
- the local kind-of-activity unit (local KAU);
- the institutional unit;
- the unit of homogeneous production (UHP);
- the local unit of homogeneous production (local UHP).

24. The relationship between the different types of statistical units is illustrated in the following table:

Classification rules for units

25. The units included in statistical registers\(^2\) are classified by NACE Rev.1.1. The interpretation of NACE Rev.1.1 is helped by the addition of explanatory notes, by decisions of the NACE Rev.1.1 management committee, by correspondence tables, and by reference to other classification systems such as the CPC, CPA, HS, and CN\(^3\).

26. Each unit is classified on the basis of the activities carried out within it. In certain cases, a unit cannot be classified separately as links with other units may have to be taken into consideration.

27. Units should be classified to the category that best describes their activity, taking into account not only the output structure but also the input structure, including the production process.

Basic classification rules

Value-added

28. Value added is the basic concept for the determination of the classification of a unit according to its economic activity. Being the difference between output and intermediate consumption, value added is an additive measure of the contribution of each economic unit to Gross Domestic Product (GDP). The relevant valuation concept is gross value added at basic prices. Gross value added at basic prices is defined as the difference between output at basic prices and intermediate consumption at purchaser’s prices. Thus, value added at basic prices consists of other taxes on production, net compensation of employees, consumption of fixed capital and an operating surplus balancing item.

29. Economic activities are defined in NACE Rev.1.1. A unit may perform one or more economic activities falling under one or more positions in NACE Rev.1.1. Units are classified according to their principal activity. The principal activity is the activity which contributes most to the value added of the unit at basic prices.

Within one NACE class

30. In the simple case where, at class level, a unit performs only one activity, the activity classification of that unit is determined by the position of NACE Rev.1.1 which covers the activity of that unit. Where a unit, at class level, performs more than one activity but all of them fall under the same position of NACE Rev.1.1, then the activity classification of that unit is determined by the position of NACE Rev.1.1 in which all these activities are covered.

In different classes

31. In the case where, at class level, a unit performs activities falling under different positions of NACE Rev.1.1, rules are necessary for the determination of the principal activity. In the simple case that, at class level, one activity accounts for more than 50% of value added, this determines the classification of the unit.

32. Where a unit performs activities falling in only two different positions of NACE Rev.1.1, there will always be one position which accounts for more than 50% of value added, except in the highly unlikely case that both activities of the different positions of NACE Rev.1.1 have equal shares of 50%.

33. In the more complex case where a unit performs more than two activities falling into more than two different positions of NACE Rev.1.1, with none of them accounting for more than 50% of value added, the activity classification of that unit has to be determined by using the top-down method.

3 The Combined Nomenclature, a further disaggregation of the Harmonized System.
Top-down method

34. The top-down method follows a hierarchical principle. The classification of a unit at the lowest level of the classification must be consistent with the classification of the unit at the higher levels. To satisfy this condition, the process starts with the identification of the relevant position at the highest level and progresses down through the levels of the classification in the following way:

- Identify the section which has the highest share of the value added.
- Within this section, identify the division which has the highest share of the value added.
- Within this division, identify of the group which has the highest share of the valued added.
- Within this group, identify of the class which has the highest share of value added.

Identify the class

- Class 29.53 Manufacture of machinery for food, beverage and tobacco processing 21%
- Class 29.55 Manufacture of machinery for paper and paperboard production 8%

The principle activity

35. The principal activity is, therefore, 29.53 Manufacture of machinery for food, beverage and tobacco processing, although the class with the biggest share of value added is class: 51.88 Wholesale of agricultural machinery and accessories and implements, including tractors.

36. If the allocation had been made directly to the class with the largest share of value added this would have achieved the strange result of putting this enterprise outside manufacturing.
37. The top-down method satisfies the principle that the activity classification should be consistent with the principal activity of the unit at the aggregated level of the activity classification. At lower levels of the classification the share of value added of the position of NACE Rev.1.1 that results from using the top-down method will not necessarily account for more than 50% of total valued added of that unit. It is also possible at the highest hierarchical level of NACE Rev.1.1 for no position to account for more than 50% of value added.

38. The top-down method permits determination of the principal activity of a unit down to the lowest level of the hierarchical activity classification. In practice, the NACE Rev.1.1 regulation itself does not stipulate the use of a certain hierarchical level.

39. In order to determine the principal activity of a unit the shares of value added for the activities falling under different positions of NACE Rev.1.1 of that unit have to be known. However, in practice, it is often not possible to obtain information on value added for the different activities performed and the determination of the activity classification has to be done by using substitute criteria. Such criteria could be:

- Substitutes based on output
  - gross output of the unit that is attributable to the goods or services associated with each activity;
  - value of sales of those groups of products falling within each activity.

- Substitutes based on input
  - wages and salaries attributable to the different activities;
  - employment in the different activities of the unit.

40. The use of substitute criteria does not change the methods for determining the principal activity nor the rules of the top-down method. The substitutes are only operational approximations of value added data.

41. However, simple use of substitutes may sometimes be misleading. This will always be the case when the structure of the substitute criteria is not proportional to the (unknown) value added.

42. Using the sales (turnover) criteria, it immediately becomes evident that in certain cases the proportionality of turnover and value added is not valid. For example, trade turnover usually has a much lower share of value added than, say, a manufacturing activity. Other examples of cases where turnover is not a good proxy are turnover of forwarding agents or of general contractors. Even within manufacturing, the relation between sales and the resulting value added may vary between and within activities. In some cases, a turnover figure makes no sense or does not exist, for example for financial intermediation activities and insurance activities. The same considerations should be borne in mind when using gross output data as substitute criteria.

43. Many units perform trade and other activities. In such cases, trade turnover figures are the most unsuitable indicators for value added. A much better indicator is the gross margin (the difference between the trade turnover and purchases of goods for resale adjusted by changes in stocks). However, trade margins may vary between wholesale and retail trade and also within a single trade activity area. In addition, the specific classification rules for retail trade as set out in paragraphs 66–74, must be considered.
44. Similar precautions have to be considered when input based substitute criteria are applied. The proportionality between wages and salaries or employment and value added is not reliable if the capital intensity of the various activities is different. Higher capital intensity normally implies higher depreciation and a lower share of wages and salaries in value added. Capital intensity varies substantially between different economic activities and also between activities of the same NACE Rev.1.1 class. For example, the activity of manufacturing splints will probably have a lower capital intensity than the manufacture of pacemakers. However, both fall into the same NACE Rev.1.1 class (33.10).

### Activity specific rules

45. The basic rules for determining the principal activity of a statistical unit are set out above. There are, however, certain economic processes and phenomena which need to be defined clearly if statistical units are to be treated in a uniform way. These definitions feature in this section.

46. Vertical integration of activities occurs where the different stages of production are carried out in succession by the same unit and where the output of one process serves as input to the next, for example, tree felling combined with saw milling, a clay pit combined with a brickworks, or production of synthetic fibres associated with a textile mill.

47. A unit with a vertically integrated chain of activities should generally be classified to the activity that contributes most to the value added of the goods or services produced. However, for practical reasons of data availability, it is often the final output that is decisive.

48. The approach above also applies in the special case of horizontally integrated units, that is, units where several types of activities are carried out simultaneously using the same factors of production but cannot be segregated into separate statistical units (for example, manufacture of bakery products combined with manufacture of chocolate confectionery).

### Activities under-taken on a fee or contract basis

49. Units carrying out an activity on a fee or contract basis are classified with units producing the same goods or services on their own account. There are two basic types:

- **Work based on plans**
  Work based on plans, where the contractor provides the subcontractor with all the technical specifications required for the production of the product he has ordered. This situation is found, in particular, in the metals sector (forging, cutting, stamping and foundry work);

- **Work done to order**
  Work done to order, where the subcontractor carries out a special process on an object provided by the contractor. The object can be anything from raw material to a machined mechanical part. Examples include the processing of metals (chrome plating) and the preparation of fruit for canning.

50. Converters are units which sell goods or services under their own name, but arrange for their production by others. These units are classified to Sector G (wholesale and retail) except when they own the legal right to produce the goods or services and the production concept, in which case they are classified as if they produce the goods or services themselves.

51. Units principally engaged in the installation or assembly of any items or equipment necessary for a building to function as such are classified to construction (division 45). This covers such items as heating and ventilation equipment, lifts and escalators, electricity, gas and water supply, windows and doors.
52. Installation and assembly normally also includes start-up services, including all work necessary to ensure trouble-free operation on site, any basic instruction of the operatives and maintenance of the equipment.

53. Installation that is performed as a service incidental to the sale of equipment, for example, the installation of domestic electrical equipment by the retailer, is an associated activity and is classified in the same way as the main activity.

54. Units that repair, maintain or overhaul equipment are classified to the same class as the units that produce it except that:

- units that repair or maintain motor vehicles and motorcycles are classified to groups 50.2 and 50.4 respectively;
- units that repair personal and household goods are classified to group 52.7;
- units that repair or maintain domestic central heating boilers and burners are classified to class 45.33;
- units that repair or maintain computers and office equipment are classified to group 72.5.

55. In NACE Rev.1.1, wholesale and retail trade comprises all units whose principal economic activity involves purchasing transportable goods and reselling them and/or acting as an agent between sellers and buyers of goods. Such goods are subject only to handling and packaging; they are not transformed in any substantial way.

56. Wholesale and retail trade comprises not only direct trading between two parties, but also that arranged on behalf of one or more third parties. It is, however, essential that the main activity should be that of trading products that have not been altered more than as is customary by the seller.

57. Handling that is customary in trade does not affect the basic character of the merchandise and may include, for example, sorting, separating, mixing and packaging.

58. In wholesale trade, there are a number of branches of economic activity where the handling customary in trade is of considerable importance. A typical example is the repackaging of products before delivery to the retailer.

59. Also included are services in support of the sale of products such as the delivery and installation of electrical appliances.

60. Commission trade and wholesale trade are combined in one division in NACE Rev.1.1. The commission trade classes form one group (51.1), while the wholesale trade classes are allocated to six groups (51.2-51.9). A separate division comprises retail trade, within which there are six groups for different aspects of retail trade and an additional one for the repair of personal and household goods. The motor vehicles trade, together with the maintenance and repair of motor vehicles and the retail sale of automotive fuel, forms division 50.

61. Group 51.1, wholesale commission trade, comprises all units whose principal activity is trading goods on behalf of third parties. They may be commercial agents or brokers or trading associations conducting transactions on third party account, but retail commission trade is not shown separately. It is classified to the relevant class of division 52.
62. The wholesale trade groups comprise all units whose economic activity consists primarily in reselling merchandise in their own name to retailers, industrial, commercial, institutional or professional users or to other wholesalers.

63. Wholesale trade is classified only by the range of products. Other criteria are not taken into account, for example, whether it is domestic wholesale trade or import and/or export trade.

64. The retail trade groups 52.1 to 52.6 of NACE Rev.1.1 comprise all units whose economic activity consists primarily of selling goods on own or third party account predominantly to households.

65. Retail trade is mostly carried out in premises accessible to anyone. There are, however, other forms of retail activity such as mail, telephone or internet selling, trading from mobile vehicles and from temporary locations and repository services.

66. Retail trade is classified first by type of sale outlet (retail trade in stores: groups 52.1 to 52.5; retail trade not in stores: group 52.6). Retail trade in stores is further subdivided into retail sale of new goods (groups 52.1 to 52.4) and retail sale of used goods (group 52.5). For retail sale of new goods in stores there exists a further distinction between specialised retail sale (groups 52.2 to 52.4) and non-specialised retail sale (group 52.1). Specialised retail sale of new goods in stores is subdivided by the range of products sold. These subdivisions have to be considered as additional levels and have to be applied when using the top down method.

67. No attempt is made to reflect other possible aspects of retail activity such as the kind of service (for example traditional service or self-service), outlets run by voluntary services or purchasing associations, or the distinction between co-operative and other retail trade.

68. Units whose main activity in terms of value added is obviously retail trade from shop premises have to be allocated to one of the classes 52.11 to 52.50. Having determined the range of products sold by the individual units, allocation should be made according to the rules set out in the following paragraphs.

69. If the products sold comprise exclusively those of one NACE Rev.1.1 class, allocation is obviously to that class. Example: A unit sells only beverages on its shop premises. The unit is wholly allocated to class 52.25.
70. If the products sold comprise commodities of several NACE Rev.1.1 classes, determine whether any one of these classes accounts for a share of 50% or more in terms of value added. In this case, the unit should be allocated to that class.

Examples: (a) 52.41 – 20%  b) 52.21 – 10%
52.42 – 30%  52.24 – 10%
52.43 – 50%  52.25 – 10%
52.33 – 15%  52.41 – 55%

Allocation to 52.43  Allocation to 52.41

71. If the products sold comprise several NACE Rev.1.1 classes, none of which accounts for a share of 50% or more in terms of value added, further analysis is necessary to establish the relevant allocation. For this, the top down method has to be used by considering the additional retail levels mentioned above.

52.42 – 25%  52.42 – 15%  52.42 – 5%
52.43 – 10%  52.43 – 20%  52.43 – 10%
52.50 – 40%  52.50 – 25%  52.50 – 40%
52.62 – 25%  52.62 – 40%  52.62 – 45%

Allocation to 52.50  Allocation to 52.43  Allocation to 52.50

72. When choosing between specialised retail trade 52.2 – 52.4 and non-specialised retail trade 52.1 the outcome will depend on the number of NACE Rev.1.1 classes involved, and the way in which activity is distributed across those classes.

73. If the products sold comprise up to four classes of NACE Rev.1.1 groups 52.2 and/or 52.3 and/or 52.4, none of which accounts for a share of 50% or more in terms of value added, but each represents 5% or more of value added, a specialised trade is still involved. It is then necessary to determine only the focus of the activities on the basis of value added. The main activity, selecting first the main group and then the class within that group, will then determine the allocation.

52.21 – 30%  52.21 – 30%  52.21 – 20%
52.22 – 5%  52.22 – 15%  52.22 – 5%
52.31 – 45%  52.31 – 40%  52.31 – 35%
52.43 – 20%  52.43 – 15%  52.43 – 40%

Allocation to 52.31  Allocation to 52.21  Allocation to 52.43

74. If the products sold comprise five or more classes of groups 52.2, 52.3 and 52.4, each representing 5% or more of value added, but none of which accounts for a share of 50% or more, this should be classified as a non-specialised store and allocated to group 52.1. If food, beverages and tobacco represent at least 35% of value added, allocation will be made to NACE Rev.1.1 class 52.11. In all other cases, allocation should be to class 52.12.

52.21 – 5%  52.21 – 20%  52.21 – 5%
52.22 – 10%  52.22 – 15%  52.22 – 5%
52.31 – 15%  52.31 – 10%  52.31 – 40%
52.33 – 25%  52.33 – 10%  52.33 – 40%
52.44 – 45%  52.44 – 45%  52.44 – 10%

Allocation to 52.12  Allocation to 52.11  Allocation to 52.12

Note: The allocation rules are always based on the retail activity of the unit. If, in addition to its retail trade, a unit has a secondary activity which also provides services
or produces goods, the allocation of the unit to the appropriate class of division 52 is determined by the composition of its retail activity only.

Section L: Public administration
75. The classification criteria used in the private sector are also applied to government bodies. Consequently, not all government bodies are classified to Section L. Units carrying out activities at the national, regional or local levels that are specifically attributable to other areas of NACE Rev.1.1 are classified in the appropriate section (for example, education in Section M, health and social work in Section N) rather than in Section L Public administration and defence; compulsory social security.

For example, a higher education establishment administered by central or local government is allocated to class 80.30 and a hospital similarly administered is allocated to class 85.11.

Section P: Private households employing domestic staff and undifferentiated production activities of households for own use
76. Class 95.00 includes the activities of private households employing domestic personnel only. The result of this activity is considered production by the national accounts system and for this purpose and for certain surveys this class has been included in NACE Rev.1.1. The domestic personnel themselves should not be classified in classes 95.00.

77. Based on ISIC Rev.3.1, two new divisions were included in NACE Rev. 1.1 (division 96 Undifferentiated goods-producing activities of private households for own use and division 97 Undifferentiated service-producing activities of private households for own use) in order to cover all production activities, even if only done by private households for their own use.

78. These divisions would normally not be relevant in business statistics, but would be needed for data collections covering business statistics, household and subsistence activities.

Changes in the classification of units
79. The principal activity may change suddenly from one statistical period to the next, either because of seasonal factors or because of a management decision to vary the pattern of output. Alternatively, a change in the pattern of output or sales may take place gradually over several years. In each case, the classification of the unit should be changed, but too frequent changes distort statistics and make interpretation extremely difficult.

80. To avoid frequent changes, it is necessary to have a stability rule. Without such a rule there would be apparent changes in the economic demography of the business population which would be no more than statistical artifacts. The working rule is that the formerly secondary activity should exceed the activity to which the unit is currently classified for two years before the classification is changed.

81. Changes in the classification of units for the purposes of statistical inquiries should not be made more than once a year, either at fixed dates or as the information becomes available. More frequent changes would result in inconsistency between short term (monthly and quarterly) and longer term statistics.
Glossary

82. This glossary gives a further description of some of the terms used throughout the NACE Rev.1.1 Introduction, Annex and Explanatory Notes. Every attempt has been made to ensure that the descriptions are consistent with the definitions of the terms when used elsewhere, but these descriptions are not intended to give all-purpose definitive meanings of the words. The purpose of this glossary is merely to help the user of NACE Rev.1.1 to interpret it correctly.

By-products
83. An exclusive by-product is a product technologically linked to the production of other products in the same group, but which is not produced in any other group (for example, molasses linked to the production of sugar). Exclusive by-products are used as inputs for the manufacture of other products.

84. An ordinary by-product (that is, a by-product which is not exclusive to a single group) is a product technologically linked to the production of other products, but which is produced in several groups (for example, the hydrogen produced during petroleum refining is technologically linked to that produced in petrochemical manufacture and coal carbonization and identical to that produced in the group comprising other basic chemical products).

Capital goods
85. Capital goods are goods, other than material inputs and fuel, used for the production of other goods and/or services. They include factory buildings, machinery, locomotives, lorries and tractors. Land is not usually regarded as a capital good.

Commodity
86. A commodity is a transportable good that may be exchanged. It may be one of a run from a production line, a unique item (Mona Lisa) or the material medium for a service (software diskette). This is the concept used for customs classifications.

Industrial process
87. An industrial process is a transformation process whether physical, chemical, manual, or whatever, used in the manufacture of new products (whether consumer, intermediate or investment goods), in the processing of used products or in the provision of services to industry as defined in Sections C (extractive industries), D (manufacturing industry), E (production and distribution of Electricity, gas and water) and F (construction industry).

Machinery: domestic or household
88. Machinery and equipment of a type designed principally for use by private households, for example, household washing machines.

Machinery: industrial
89. Machinery and equipment of a type designed principally for use in non-domestic premises, for example, machine tools, laundry-type washing machines.

Manufacturing industry
90. All activities included within Section D. Both cottage industry and large-scale activities are included. It should be noted that the use of heavy plant or machinery is not exclusive to Section D.

Product
91. A product is the outcome of economic activity. It is the generic term applied to goods and services.

Finished products
92. Products for which processing has been completed.

Semi-finished products
93. Products that have undergone some processing but require further processing before they are ready for use. They may be sold to other manufacturers for further processing. Typical examples would include rough metal castings sold for finishing elsewhere.
Production 94. Production is an activity resulting in a product. It is used with reference to the whole range of economic activities. The term is not reserved for the agricultural, mining or manufacturing sectors. It is also used in relation to the service sector. More specific terms may be used to denote production. Provision of services, processing and manufacturing are examples, depending on the branch of activity. Production may be measured in various ways either in physical terms or according to value.

Transformation 95. Transformation is a process that modifies the nature, composition or form of raw materials, semi-finished or finished products for the purpose of obtaining new products.

Treatment 96. A process that is carried out, inter alia, for the purpose of protecting certain products, for giving them certain properties or for preventing any harmful effects that might otherwise result from their use. Examples are the treatment of crops, wood, metals and waste.

Value added 97. The gross value added is the value of gross output less the cost of material and other intermediate inputs, adjusted for any change in stocks.

Section A  Agriculture, Hunting and Forestry

Section A covers the exploitation of vegetable and animal resources. This section comprises the activities of growing crops, raising animals, harvesting timber and harvesting other plants and animals from a farm or their natural habitats.

01  Agriculture, Hunting and Related Service Activities

Division 01 distinguishes between two basic activities:

- Production of crop products (01.1: Growing of crops)
- Production of animal products (01.2: Farming of animals)

Within 01.1 a distinction is made between:

- Field crops which generally follow a yearly cycle (01.11 and 01.12), such as cereal, vegetable or flower growing
- Crops with a long cycle such as plantations (e.g. coffee, cocoa, etc.), vineyards and orchards (01.13).

Within group 01.2 (Farming of animals), the activities are grouped according to the type of animal and not according to the type of product produced (e.g. meat, milk, hide) and without distinguishing between confined (non-grazing) and open pasture farming.

Group 01.3 (Mixed farming) departs from the usual principles for identifying main activity. It accepts that many agricultural holdings have reasonably balanced crop and animal production and that it would be arbitrary to classify them in one category or the other.

Certain operations such as soil preparation, planting, harvesting and management, which are normally part of farm operations, may be carried out by agricultural support units on a fee or contract basis, as agricultural (01.41) or animal husbandry (01.42) service activities.

Agricultural activity excludes any subsequent processing of the agricultural products (classified under division 15: Manufacture of food products, and division 16: Manufacture of tobacco products) beyond that needed to prepare them for the primary markets. However, as an exception to the general rule for classification of integrated activities, a unit processing its own agricultural production on the farm is classified to division 01, even though the output normally is the product of divisions 15 and 16. Examples are:

- Growing of grapes and production of wine from these
- Growing of olives and production of olive oil from these

The division excludes field construction (e.g. agricultural land terracing, drainage, preparing rice paddies), classified in division 45 (Construction), and buyers and co-operative associations engaged in marketing of farm products, classified in section G (Wholesale and retail trade).

Further processing of wood beginning with sawmilling and planing of wood, which is generally done away from the logging area, classified to Manufacture of wood and wood products (division 20), and production of charcoal is classified under division 24.

Fishing is defined as the use of fishery resources from marine or freshwater environments, with the goal of capturing or gathering fish, crustaceans, molluscs and other marine products (e.g. pearls, sponges).

Section B also includes fish farming and aquaculture activities which produce similar products. It includes activities which are normally integrated in the process of production for own account (e.g. seeding oysters for pearl production).

Section B does not include building and repairing of boats (35.11) and sport and recreational fishing (92.62). Processing of fish, crustaceans or molluscs is excluded, whether at land based plants or on factory ships (fish industry: 15.20). However, processing taking place on board ships which fish is also classified to section B.

**Section C** Mining and Quarrying

Mining and quarrying include the extraction of minerals occurring naturally as solids (coal and ores), liquids (petroleum), or gases (natural gas). Extraction can be by underground or surface mining or well operation.

This section includes supplementary operations needed to transport and market the mineral products, e.g. crushing, grinding, cleaning, drying, sorting, concentrating ores, liquefaction of natural gas and agglomeration of solid fuels. These operations are often accomplished by the units which extracted the resource and/or others located nearby.

Mining activities are classified into divisions, groups and classes on the basis of the principal mineral produced. Subsection CA is concerned with mining and quarrying of energy producing materials (coal, lignite and peat, hydrocarbons, uranium ore); Subsection CB concerns non-energy producing materials (metal ores, various minerals and quarry products).

Section D Manufacturing

Manufacturing activity is the mechanical, physical or chemical transformation of materials, substances or components into new products. The materials, substances or components transformed are raw materials that are products of agriculture, fishing, mining or quarrying as well as products of other manufacturing activities.

The units in the manufacturing section are often described as plants, factories or mills and characteristically use power-driven machines and materials-handling equipment. However, units that transform materials or substances into new products by hand or in the worker’s home and those engaged in selling to the general public products made on the same premises from which they are sold, such as bakeries and custom tailors, are also included in this section.

Manufacturing units may process materials or may contract with other units to process their materials for them. Both types of unit are included in manufacturing.

The new manufactured product may be finished in the sense that it is ready for utilisation or consumption, or it may be semi-finished to become an input for further manufacturing. For example, the product of the alumina refinery is the input used in the primary production of aluminium; primary aluminium is the input to an aluminium wire drawing plant; and aluminium wire is the input for the manufacture of fabricated wire products.

Assembly of the component parts of manufactured products is considered manufacturing, except in cases where the activity is appropriately classified in any class of division 45 (Construction).

Assembly and installation of machinery and equipment in mining, manufacturing, commercial or other units, when carried out as a specialised activity, is classified in the same class of manufacturing as manufacture of the item installed.

Assembly and installation of machinery and equipment which is performed as a service incidental to the sale of the goods by a unit primarily engaged in manufacturing, wholesale trade or retail trade, is classified with its main activity.

Maintenance and repair of industrial, commercial and similar machinery and equipment are, in general, classified in the same class as the manufacture of the goods. However, repair of office and computing machinery is classified in class 72.50. Repair of household appliances, equipment and furnishings, motor vehicles and other consumer goods are, as a general rule, classified in the appropriate class of division 50 (Sale, maintenance and repair of motor vehicles and motorcycles; retail sale of automotive fuel) or 52 (Retail trade, except of motor vehicles and motorcycles; repair of personal and household goods) in accordance with the kind of goods which are repaired.

Substantial alteration, renovation or reconstruction of goods is generally considered to be manufacturing.

Manufacture of specialised components and parts of, and accessories and attachments to, machinery and equipment is, as a general rule, classified in the same class as the manufacture of the machinery and equipment for which the parts and accessories are intended. Manufacture of non-specialised components and parts of machinery and equipment, e.g. engines, pistons, electric motors, electrical assemblies, valves, gears, roller bearings, is classified in the appropriate class of manufacturing, without regard to the machinery and equipment in which these items may be included.

The boundaries between manufacturing and the other sectors of the classification system can be somewhat blurred. The manufacturing activity is engaged in the transformation of the materials into new products. The output is a new product. However, the definition of what constitutes a new product can be somewhat subjective. As clarification the following activities are considered manufacturing in SIC(2003):

- milk pasteurising and bottling
- fresh fish processing (oyster shucking, fish filleting)
- printing and related activities
- ready-mixed concrete production
- leather converting
- wood preserving
- electroplating, metal heat treating and polishing
- fabricating signs and advertising displays
- rebuilding or re-manufacturing machinery (e.g. automobile engines)
- ship repair and renovation
- tyre retreading

Conversely, there are activities that are sometimes considered manufacturing, but which for SIC(2003), are classified in another section (i.e. not classified as manufacturing). They include:

- logging, classified in section A (Agriculture, hunting and forestry)
- processing of ores and other minerals, classified in section C (Mining)
- the construction of structures and fabricating operations performed at the site of construction, classified in section F (Construction)
– the activity of breaking of bulk and redistribution in smaller lots, including packaging, repackaging or bottling of products such as liquors or chemicals, the customised assembly of computers, sorting of scrap, mixing of paints to customer's order, and cutting of metals to customer's order to produce a modified version of the same product, not a new product, and are classified to section G (Wholesale and retail trade).

Subsection DA Manufacture of Food Products, Beverages and Tobacco

The food industry processes the products of agriculture, animal husbandry and fishing into food and drink for humans or animals and includes the production of various intermediate products which are not directly food products. The activity often generates associated products of greater or lesser value (e.g. hides from slaughtering, or oilcake from oil production).

Each division is organised by activities dealing with different kinds of products: meat; fish; fruit and vegetables; fats and oils; milk products; grain milling; animal feeds; other food products; beverages and tobacco. Production can be done for own account, as well as in the case of, say, custom slaughtering for third parties.

Some activities are considered manufacturing e.g. bakeries, pastry shops, and prepared meat shops which sell their own production, even though there is retail sale of the products in their own shop. However, where the processing is minimal and does not lead to a real transformation (e.g. butchers, fishmongers) the unit is classified to section G (Wholesale and retail trade).

The treatment of slaughter waste to produce animal feeds is classified in 15.7, while processing food, beverage and tobacco waste into secondary raw materials is classified to 37.20, and disposal of food, beverage and tobacco waste in division 90.

Publishers may publish works originally created by others for which they have obtained the rights and/or works that they have created in-house.
The printing activities print products such as newspapers, books, periodicals, business forms, greeting cards and other materials, and perform support activities, such as bookbinding, platemaking services and data imaging. The support activities included here are an integral part of the printing industry and a product (a printing plate, a bound book or a computer disk or file) that is an integral part of the printing industry is almost always provided by these operations.

Processes used in printing include a variety of methods used to transfer an image from a plate, screen or computer file to some medium such as paper, plastics, metal, textile articles or wood. The most prominent of these methods is the transfer of an image from a plate or screen to a medium (lithographic, gravure, screen and flexographic printing). A rapidly growing new technology uses a computer file to directly “drive” the printing mechanism to create the image. This new technology also includes new electrostatic and other types of equipment (digital or non-impact printing).

Section G Wholesale and Retail Trade; Repair of Motor Vehicles, Motorcycles and Personal and Household Goods

This section includes wholesale and retail sale (sale without transformation) of any type of goods and services incidental to the sale of the merchandise. Wholesaling and retailing are the final steps in the distribution of merchandise. Also included in this section is the repair of motor vehicles and installation and repair of personal and household goods.

Sale without transformation is considered to include the usual operations or manipulations associated with trade, e.g. sorting, grading and assembling of goods, mixing (blending) of goods (e.g. wine), bottling (with or without preceding bottle cleaning), packing, breaking bulk and re-packing for distribution in smaller lots, storage (whether or not frozen or chilled), cleaning and drying of agricultural products and cutting out of wooden fibreboards or metal sheets on own account.

Wholesale is the re-sale (sale without transformation) of new and used goods to retailers, to industrial, commercial, institutional or professional users, or to other wholesalers. It also includes acting as agents or brokers in buying merchandise for, or selling merchandise to, such persons or companies. The principal types of business included are wholesalers who take title to the goods they sell, such as wholesale merchants or jobbers, industrial distributors, exporters, importers and co-operative buying associations. Sales branches and sales offices (but not retail stores) which are maintained by manufacturing or mining units separately from their plants or mines for the purpose of marketing their products and which do not merely take orders to be filled by direct shipment from the plants or mines are also included. Also in wholesaling are merchandise and commodity brokers, commission merchants and agents and assemblers, and buyers and co-operative associations engaged in the marketing of farm products. Wholesalers frequently physically assemble, sort and grade goods in large lots, break bulk, repack, redistribute in smaller lots (e.g. pharmaceuticals) store, refrigerate, deliver and install goods, and engage in sales promotion and label design for their customers.

Retailing is the re-sale (sale without transformation) of new and used goods mainly to the general public for personal or household consumption, by shops, department stores, stalls, mail-order houses, hawkers and peddlers, consumer co-operatives, auction houses, etc. Most retailers take title to the goods they sell, but some act as agents for a principal and sell either on consignment or on a commission basis.

Section H  Hotels and Restaurants

55  Hotels and Restaurants

This section comprises the provision to customers of lodging and/or prepared meals, snacks and beverages for immediate consumption. The section includes both accommodation and food services because the two activities are often combined in one unit.

There is some overlap between activities in section H, as the sale of beverages is an independent activity and also part of restaurant activity (providing meals, with drinks). In the latter case, sale of beverages is classified together with sale of meals in 55.3 (Restaurants). Similarly, a restaurant activity is a specific activity but may also be implicitly included in lodgings.

Lodging units provide lodgings or short-term accommodation for travellers, holidaymakers and others. There is a wide range of units. Some provide lodgings only while others also provide meals and recreational facilities. The type of complementary services provided may vary from unit to unit.

Restaurant activities provide complete meals fit for immediate consumption, whether they are traditional restaurants, self-service or take away restaurants, or permanent fish and chip stands and the like, with or without seating. Decisive is the fact that meals fit for immediate consumption are offered, not the kind of facility providing them. Excluded is the production of meals not fit for immediate consumption or not planned to be consumed immediately or of prepared food which is not considered to be a meal (cf. division 15, Manufacture of food products and beverages). Also excluded is the sale of food which is not self-manufactured even if a meal fit for immediate consumption (cf. section G, Wholesale and retail trade).

Section L  

Public Administration and Defence; Compulsory Social Security

The classification criteria used in the private sector are, by analogy, applied to both local authorities and public administration. Consequently, few government bodies are classified to Section L. The general rule is that operational, as opposed to administrative, policy or similar units, should be classified to the appropriate UK SIC(2003) Section (for example, a primary school in Section M; a National Health Service hospital in Section N). However, purely or mainly administrative, policy or similar units should be classified to Section L. Where, say, a central government building carries out a mainly administrative function but also has a secondary, but not separately identifiable, operational role it should be classified to Section L. Mainly operational units, where they are identifiable as such, should always be classified outside Section L. Whether the main activity is operational, administrative, policy or similar depends, in part, on the type of unit and, therefore, on the spread of activity in which it is involved.
