This article presents estimates for regional gross value added (GVA) at current basic prices for 1989 to 2002/03, published in December 2004.

The headline estimates are a moving average based trend of the unadjusted estimates for each region. These adjusted series remove some year to year volatility in the unadjusted series.

In Brief (NUTS1 2003 Estimates NUTS2&3 2002 Estimates)

GVA by Region

- In 2003 the region with the largest GVA was London with 16.3 per cent of total UK GVA, excluding Extra-regio.
- Northern Ireland had the smallest share at 2.3 per cent.
- GVA by NUTS2 and 3
 - In 2002 the NUTS2 area with the largest GVA was Inner London with £106bn
 - The area with the smallest GVA was Highlands & Islands with £4bn.
 - In 2002 the NUTS3 area of Inner London West has the highest share of GVA with 7.7 per cent of UK GVA. The next highest area was Inner London East which contributes 4 per cent to the UK GVA. The highest contribution to the UK GVA outside London was Greater Manchester South with 2.6 per cent.

Growth in total GVA

- In 2003 UK total GVA grew by 5.4 per cent compared with 2002; UK total GVA excluding Extra-regio grew by 5.0 per cent.
 - Total GVA increased in all the UK regions, although there was variation in the rate of increase.
 - The largest growth rate was in the East Midlands 6.3 per cent in 2003.
 - London had the smallest growth rate: up by 2.6 per cent from 2003.
 - The growth in total GVA in NUTS2 areas between 2001 and 2002 was highest in Inner London (8.6 per cent), Surrey, East and West Sussex and Cheshire (both 6.2 per cent).
 - NUTS2 areas with the lowest growth between 2001 and 2002 were Cumbria (2.4 per cent), Highlands & Islands (2.9 per cent), and Outer London (3.3 per cent).

GVA per head of Population

- In 2003, GVA per head was £15,980 for the UK as a whole (excluding Extra-regio).
 - London had the largest GVA per head £20,990.
 - Wales had the lowest GVA per head £12,629.
 - London, the South East and East of England were the only regions with a GVA per head of population above the average for UK.
 - At the NUTS2 level for 2002, Inner London had the highest GVA per head of £36,717, more than double the UK average of £15,273. The next highest were Berkshire, Buckinghamshire & Oxfordshire £21,460 and North East Scotland £20,234.
 - Cornwall & the Isles of Scilly had the lowest GVA per head £9,525. The next lowest were West Wales & the Valleys £9,985 and Highlands & Islands £10,524.

I Introduction

The regional GVA estimates published in this article are calculated according to the income approach¹. They includes revisions for 1989 to 2002 (NUTS1), 1995 to 2001 (NUTS2 & 3), and first estimates for 2003 (NUTS1) and 2002 (NUTS2 & 3).

The current basic price estimates for 1989 to 2002 (NUTS1) were first published by the Office for National Statistics (ONS) on 30 April 2004; 1995 to 2001 (NUTS2) on 30 October 2003; and 1995 to 2001 (NUTS3) on 11 December 2004.

Blue Book national controls

The regional GVA estimates NUTS1 (1989 – 2003) and NUTS2 & 3 1995 to 2002 estimates are consistent with estimates of UK GVA published in National Accounts Blue Book 2004.

Wages and salaries data from Inland Revenue

Inland Revenue (IR) data has been incorporated in the estimates for the first time since 1998 (reference period 1996) after the successful conclusion to the work, highlighted in the April 2004 ONS publication “Regional Gross Value Added”, in assessing the suitability of IR regional information for use in the estimation of NUTS1 GVA. For more detail see Section II.

Earnings Estimates

For the first time this year ONS produced earnings estimates under the new Annual Survey of Hours and Earnings (ASHE) methodology. It was expected that the earnings estimates produced under the new methodologies would be used within this publication. This has not been possible as these data were not available at either the required geographic breakdown or industry level. Therefore, New Earnings Survey (NES) estimates have again been used in the calculation of regional GVA estimates. The existing NES dataset, including that for 2003, was quality assured and used in the calculation of GVA.

Employment

These estimates use employment data (Annual Business Inquiry 1 [ABI/1], Short Term Earnings Survey [STES]) consistent with that published in December 2003, as data published on 15 December 2004 was not available in time to be considered for this publication.

Allsopp Review

In March 2004, the final report of Christopher Allsopp’s review of statistics for monetary and wider economic policymaking was published. Its remit was to examine the provision of data required for regional economic policy making and to assess how well the provision of economic statistics captures structural change in the economy. The use of Inland Revenue data addresses recommendation one of the report. **ONS’ response to the review can be found at:** <http://www.statistics.gov.uk/about/data/development/default.asp>

Commuting patterns

Information on commuting patterns is used to derive the workplace-based estimates of regional GVA. Longstanding plans have been in place to investigate the commuting patterns between regions. The investigations will show if and how commuting patterns have changed and determine which regions experience a significant degree of net commuting.

An initial assessment suggests the current assumption that the only significant net commuting between NUTS1 regions is between London, the South East and East of England still stands, however, further work needs to be carried out. See Section II Developments

II Developments

Regional Accounts have made a number of improvements to the processes used to calculate these regional economic data.

These include the introduction of a quality system to improve the quality assurance processes; the move from a complex spreadsheet based system to a more stable database processing system; and some data input changes as a result of data analyses carried out. These include:

Quality adjustments of data inputs

In addition to quality assurance of processes, regional GVA estimates are produced following extensive quality assurance of the underlying raw data, in line with practices in place for National Accounts estimates. As part of this process a number of discrepancies were found in the raw data, which have had some impact at the regional level. The following examples show how some of the arising issues have been resolved.

Employment: - ABI/1 and STES

ABI/1 employment data are used in the estimation of GVA at NUTS2 and NUTS3 only whilst STES data is used at NUTS 1. Adjustments are considered for all series where there are obvious outliers that are not supported by additional evidence. Examples of these, with adjustments, are shown below.

The following examples are based on ABI/1 data. Full time employment in the NUTS2 area of Inner London, which includes the boroughs of Tower Hamlets, Westminster, City of London, Islington, etc, recorded an increase in the fishing industry between 2000 and 2001 of over 1,100 (1,534 per cent) and then a decrease of over 1200 (99 per cent) in 2002. Chart A shows the original series and the adjustment made.

Similarly, Chart B shows an employment increasing by over 50 per cent in industry E (electricity, gas and water supply), in Bedfordshire and Hertfordshire in 2001; followed by a decrease of 25 per cent the following year. The employment level changes over the two years were considered inconsistent with the rest of the time series where movements were not of the same magnitude.

Business Financial Information (ABI/2)

ABI/2 data analysis

ABI/2 data are used to estimate the regional allocation of Compensation of Employees (CoE) and Gross Operating Surplus (GOS) for manufacturing industries.

The dataset used in the production of NUTS 1 GVA 1989-2003 is the ABI/2, 2001 and 2002 results, consistent with the UK figures published in September 2004. ABI/2 data used from 1998-2000, NUTS1 only, remains unchanged from that used in the April 2004 publication of regional GVA. There are some notable exceptions, where new information has become available and some small adjustments have been made (see example discussed below).

As in previous years, the ABI/2 dataset was subject to thorough quality assurance procedures at all published NUTS levels. As part of this process a number of discrepancies were found in the raw data, which have an impact on a regional level. Discussed below are examples of investigations made at NUTS 1 level, and a number of issues that have been resolved.

Information from the ABI/2 team concerning a manufacturing sector in London revealed that data had

been imputed for a business that had not responded to the survey. The imputed estimate was based on the best estimates available at the time, however a subsequent response from this business revealed that GVA was lower than had been originally imputed. This issue occurred in 1999 and is not open to revisions for the latest ABI/2 publication. Therefore, an adjustment was made in order to more accurately reflect the level of GVA (see chart C).

Issues such as the impact of toll processing¹ can distort national ABI/2 figures, which can, in turn, filter through into regional figures. As an example, a manufacturing sector in Scotland featured a range of volatile movements. Having consulted a number of further data sources it was apparent that issues at a national level were responsible, causing levels of GVA to be spread inconsistently between years. Adjustments have been made to produce a more consistent series (see Chart D).

Quality Assurance of ABI/2 data at NUTS2 & 3 level.

ABI/2 estimates take a 'top-down' approach to producing figures at lower geographical levels. That is the UK estimates are produced first, then NUTS 1 estimates, then NUTS 2 estimates and finally the NUTS 3 estimates.

Therefore when assessing the NUTS 2 and 3 ABI/2 estimates, any quality adjustments made at NUTS 1 were applied to the appropriate NUTS 2 and 3 areas.

¹ Toll processing is the performing of a service on a customers' product for a fee. The issue is complicated in this instance because it has been happening increasingly across the UK/Rest of World boundary, for example when companies have moved production functions overseas but retain ownership of the goods. Therefore, as the ABI questionnaire does not cover companies registered overseas with a UK VAT reference, this process is missed.

- The introduction of the Inland Revenue data going back to 1997

Inland Revenue

Due to quality issues IR Pay-As-You-Earn (PAYE) data has not been used in the compilation of regional (NUTS1) estimates since 1998 as mentioned in Part I. Over the last 12 months considerable resources have been put into improving the quality of the IR data used at a regional level. This included assessing the reliability of individual addresses by comparing the IR data against the NES data; both use the same sample based on national insurance numbers. The assessment took the form of matching IR data against the NES data; the latter used as the control. The NES data was assumed to be correct for 2002, the only year matched, as from that point the survey includes comprehensive information on resident addresses.

Analysis of the results suggests IR regional data have no serious data quality issues at any of the NUTS levels. Between 85 and 95 per cent of the IR residence addresses are assessed as correct at these geographic levels; and the regional distribution of IR total annual pay is, at each NUTS level, close to what it should be if all the IR addresses were corrected (based on the NES information). Chart E shows a summary of the results. Further details can be found in the attached Annex C.

Following the outcome of this exercise ONS directors have concluded that on current evidence IR (PAYE) data is of high enough quality to use in the compilation of regional GVA estimates.

In addition they also concluded that because of the reliance at a national level, with minimal adjustment, the continued exclusion of IR data at a regional level could not be supported.

III Revisions

This part of the article compares the current regional GVA estimates for 1989 to 2002 at the NUTS1 level to the previous dataset that was published in April 2004 and subsequently in the July 2004 edition of Economic Trends. A detailed analysis can be found at Annex A.

NUTS 1

The main reasons for revisions since the April 2004 NUTS1 regional publication are:

- Revisions to national controls (Blue Book 2004)

Revisions to National Controls:

The National Accounts Blue Book publication for 2004 included revisions for the period 1992-2002. National GVA only had small revisions as shown in Chart F:

However, at an industry level there are a number of large revisions, which impact on the regional allocation of GVA. This is particularly evident for industry J (Financial Intermediation) 2002 where the previously unbalanced

figure of £48.9bn (Blue Book 2003) was revised to £61.7bn (Blue Book 2004), as shown in chart G:

The largest revision, because of this, at a regional level was to London in 2002. London's GVA was revised upwards by £5.2bn. London receives the largest share of financial intermediation in the UK and therefore was revised upwards accordingly.

Extra-Region data was revised downwards by £1.8bn in 2002. This was caused by the change to the national control for 'extraction of mineral oil and natural gas', the majority of which is not allocated to any region because much of oil and gas extraction take place 'off shore'. The downward 2002 revision was from £22.7bn (Blue Book 2003) to £20.9bn (Blue Book 2004), see chart H:

The overall impact on regional GVA of revised national controls for 2002 is shown in Chart I below:

Revisions to Inland Revenue Data

As has been mentioned above, the ONS carried out a quality assurance data matching exercise and assessed that the quality of the IR (PAYE) data from 1997 to date for use in the calculation of regional GVA.

Chart J shows the revisions caused by the introduction of the new Inland Revenue data:

The region affected most by the inclusion of IR (PAYE) data from the 1997 reference year is the South East Where GVA has been revised downwards for all years from 1997 with the largest revisions being in 2001 (£5.7bn) and 2002 (£7.2bn), see chart K.

The biggest increases were in London (£3.3bn in 2000), the South West (£2.5bn in 2000) and Yorkshire & the Humber (2.64bn in 2001).

Growth Rate Changes

The impact of the revisions can be seen in the GVA year on year growth rates in chart L. Overall the growth rate for UK GVA is unchanged.

However as a result of revisions in the industrial GVA totals London's 2002 growth rate had changed for the current dataset in comparison with the growth rate for the April 2004 publication (see chart M).

The impact of the revisions to Financial Intermediation can be shown in the changes to London's growth rate for 2002. The upward revision for financial intermediation has caused the London growth rate to change from 4.4% to 6.8%.

Chart N above shows the impact of the Inland Revenue data on the GVA growth rate for South East. The growth rates have been revised downwards for the years 1997-2002 by about half a percentage point.

NUTS 2 and 3

The methodology for estimation of NUTS 2 and 3 regional GVA estimates are reliant on the availability of accurate estimates of NUTS1 GVA. Therefore many revisions at NUTS 2 and 3 are a direct result of the NUTS 1 GVA estimates.

The main revisions at NUTS 2, compared to the October 2003 are due to: -

- Revisions to Blue Book 2003 and Blue Book 2004;
- Revisions to ABI/2 data 1998 to 2001;
- Corrected survey of personal income (SPI) data, for 1999, published by the Inland Revenue;
- Revisions to employment data from the ABI/1 1998 to 2001.

However, the main cause of revisions at NUTS 2 and 3 levels are due to the revised national controls from Blue Book 2004 and incorporating the revisions from the NUTS 1 GVA estimates due to the use of IR data. Examples of these can be observed in the NUTS 2 area Derbyshire and Nottinghamshire where 1998 and 1999 were revised downwards by 2.3 and 2 per cent respectively, as shown in chart O:

At the NUTS 3 level this effect can be seen in Nottinghamshire, as shown in chart P:

Other examples of revisions at NUTS 2 and 3 include

Cornwall and the Isles of Scilly where the 1999, 2000 and 2001 have been revised upwards by 5 per cent [£192m], 7 per cent [£295m] and 11 per cent [£446m] respectively. The main cause of the revision is the change due to Blue Book 2004, and additionally a revision to the SPI data used to allocate certain elements of profits data to sole traders and partners, as shown in chart Q:

IV Latest year estimates

This part of the article looks at the estimates being released for the first time. At NUTS1 this is information for 2003 and at NUTS 2 and 3 it is 2002.

NUTS 1

Employment - STES

These regional estimates of GVA incorporate some minor revisions to STES for 2002 and the provisional 2003 data, published in July 2004. There were no other revisions.

As chart R shows, there were a number of notable changes in employment levels between 2002 and 2003. Examples include London where full-time employment in industry K (real estate, renting and business activities) decreased by around 23,000. Additionally full time employment in industry G (wholesale and retail trade) decreased by over 12,000. The impact of these two combined contributed a change in the GVA estimate of £1.6bn.

Other examples include; North West full-time employment in industry K increased by around 12,000 and Yorkshire and the Humber where full time employment in industry F (construction) increased by around 15,000. The impact of these contributed GVA increases of £0.9bn to North and Yorkshire and the Humber respectively.

Earnings - NES

The 2003 NES data had the greatest impact on London and the South East. London GVA fell by £1.2bn and South East GVA by £0.8bn.

In London, one of the main contributing factors was the growth in average weekly earnings for male-full timers in industry K (real estate, renting and business activities); between 2001 and 2002 an increase of 9 per cent (£765 [2001] to £832 [2002]) was identified. However, in 2003 this decreased by 1 per cent (£823). Similarly, South East male-full time average weekly earnings followed a similar pattern, with an increase of 8.6 per cent between 2001 (£627) and 2002 (£681) followed a 1 per cent decrease in 2003 (£670).

Earnings data had the largest positive impact on the East of England and South West both increased by £0.6bn. In the East of England one of the main contributing factors was an increase in average earnings in industry M (education) of 6.9 per cent between 2002 (£509) and 2003 (£544). One of the major contributing factors to the increase in the South West, because of earnings data, was a 6.9 per cent increase in female full time earnings between 2002 (£350) to 2003 (£374) in industry K.

NES Impact on 2003 GVA (Chart S)

NUTS 2 and 3.

Of the NUTS2 areas, the latest estimates show that Inner London had the highest growth rate of 8.6 per cent between 2001 and 2002, and Cumbria had the lowest growth rate of 2.3 per cent over the same period. Outside London and the South East, the areas with the highest growth between 2001 and 2002 were Cheshire (6.22 per cent), West Yorkshire (6.17 per cent) and Merseyside (6.0 per cent).

For London the overall growth of 8.6 per cent equates to an increase of £7.2bn between 2001 and 2002. The majority of this growth is due to the increase in industry J (financial intermediation) which increased by £7.7bn between 2001 and 2002, and this reflects the movement in the UK and the London as a whole.

The growth in Cumbria (2.4 per cent), which is less than half that of the UK (5.4 per cent) is due mainly to the negative growth in manufacturing sector (industry D) of 5.5 per cent. Whereas, within the same NUTS 1 region of the North West, the Cheshire manufacturing sector increased by over 4 per cent compared with the decrease at a national level of 2.5 per cent. This plus above average increases in

industry K, is contributing to largest growth outside London between 2001 and 2002 (see chart T)

Within a NUTS1 region, the GVA of the NUTS2 and NUTS3 areas can vary considerably. For example, the GVA per head of the NUTS1 region of London in 2002 was £23,000; the GVA per head for Inner London was £36,700 and for Outer London was £14,300. Further variation was apparent at NUTS3 level where GVA per head in 2002 for Inner London – West was £66,700 while Outer London – East and North East was £10,300.

V Future work plans

Current plans are for the regional GVA estimates for 2004 to be published in December 2005, and will take on board the revisions outlined below. Publication of regional GVA is linked to the production of the National Accounts annual Blue Book. The Blue Book is generally published six months after the end of the period to which it relates, although the latest year will not be balanced through the supply-use framework. Regional GVA data consistent with the Blue Book national control totals are then published a further six months after the Blue Book publication. Blue Book 2005 (i.e. with annual data up to 2004) is due to be published at the end of June 2005.

Estimates of sub-regional GVA for 1995 to 2003, with figures for the UK broken down into the 37 NUTS2 and 133 NUTS3 areas, are also due to be published in December 2005.

Estimates of regional gross domestic household income (GDHI), for 1995 to 2003, are planned for publication at the end of March 2005, consistent with the national household income estimates published in Blue Book 2004. Estimates of regional gross fixed capital formation (GFCF), for 1995 to 2003, are planned for publication at the end of June 2005, consistent with the national fixed capital formation estimates published in Blue Book 2004.

Further work for the 2004 GVA dataset

The following revised datasets will become available between publication of the current regional GVA estimates and the 2004 regional GVA dataset:

- The annual Blue Book will be published at the end of June 2005; this will contain revisions to UK control totals for the income components of GVA.

- Revised ABI/2 data will be published in July 2004 and will be consistent with the data underlying the Blue Book publication.
- New and revised estimates of earnings from ASHE, along with employment estimates from STES and ABI/1 will be published during 2005.

Wages and salaries data from Inland Revenue.

As mentioned above the quality assessment of the IR (PAYE) data provided a successful conclusion. It is planned that this exercise will be carried out again in 2005, matching IR (PAYE) data against for 2002/03 against the NES data for 2003. Part of the conclusion of the original exercise was the necessity to repeat the work on a regular basis to ensure the validity of the results over time.

Plans for further methods and data source improvements

Further use of ABI/1 and ABI/2 data

Annual Census of Production (ACOP) data have been used to regionally allocate wages and salaries, and gross operating surplus (GOS), for the production industries up to 1997. Service industry national control totals for both of these components were allocated for these years using estimates of wages and salaries derived from the NES and STES, as there was no equivalent to ACOP for the service industries. The ABI/2 now provides regional data on CoE and proxies for profits for both the production and most service industries from 1998. The regional GVA production team plan to assess the ABI/2 regional service industries data as a possible replacement for the current data sources. It is likely that the ABI/2 results for service industries will need extensive quality assurance before use.

During 2004 ONS introduced a new methodology to produce earnings estimates. The Annual Survey of Hours and Earnings (ASHE) methodology was used, and as mentioned above it was expected that these results would be used in this publication. However, as it possible as the ASHE estimates were not available in time at either the right geographic or industrial level. Over the coming twelve months the regional GVA production team will be assessing the impact of the new ASHE based earnings estimates and the next set of regional GVA estimates will use these estimates. It is expected that the impact will be most marked in London and the South East, with revision to all years from 1992.

Commuting patterns

Information on commuting patterns is used to derive the workplace-based estimates of regional GVA. When 2001 Census travel-to-work data become available, it is planned to investigate the commuting patterns between regions. The purpose of this proposed work is to test, and if necessary update, the current assumption that the only significant net commuting between NUTS1 regions is between London, the South East and the East of England. The investigations will show if and how commuting patterns have changed and determine which regions now experience a significant degree of net commuting.

VI Diversity of the NUTS1 Regions

Scotland, Wales, Northern Ireland and the regions of England are all different in character, industrial structure and economic performance. The table below

shows some of the differences. Scotland has the largest area, but a small population; London has by far the smallest area, but the second largest population - over 12 million. At the other extreme, Northern Ireland has a population of nearly 3 million. These large variations in the regions' populations are reflected in the size of regional GVA and incomes.

The wide variation in the size of the regions makes it difficult to compare the regions' economic performance using cash totals; comparisons are therefore usually expressed in terms of amounts per head of the population. However, it is important to note that the growth in totals may be quite different to the growth per head in regions where the population has increased or decreased. Furthermore, the level per head is determined both by the average amount of cash of the working population and by the proportion of dependants. In Northern Ireland, for example, households have a high proportion of children (25 per cent of the population were aged 16 or under in 2002 compared with 19 to 21 per cent in other regions). This will tend to depress amounts per head. Ideally the age structure of the population should therefore be taken into account when comparing figures on a per head basis.

Diversity of NUTS 1 Regions

Key Regional Statistics – Percentages of the UK

Region	Area 2002	Population ³ 2003	Total Economically Active June 02	Gross Value Added ¹ 2003	Individual Consumption Expenditure 1999	Total Household Income ² 1999
United Kingdom (=100%)	243820 sq km	59.6m	29.4m	£952bn	£586.9bn	£929.3bn
North East	3.5	4.3	3.9	3.4	3.5	3.7
North West	5.8	11.4	10.9	10.3	10.9	10.5
Yorkshire & the Humber	6.4	8.4	8.2	7.5	7.7	7.5
East Midlands	6.4	7.1	7.2	6.5	6.5	6.5
West Midlands	5.3	8.9	8.9	8.1	8.4	8.3
East	7.8	9.2	9.5	10.0	9.3	9.8
London	0.6	12.4	12.9	16.3	15.2	15.4
South East	7.8	13.6	14.4	15.6	15.7	15.5
South West	9.8	8.4	8.5	7.9	8.1	8.1
England	53.4	83.7	84.4	85.6	85.3	85.4

Scotland	32.0	8.5	8.6	8.1	8.3	8.2
Northern Ireland	5.8	2.9	2.6	2.3	2.4	2.3

1. Excluding Extra-Region and the statistical discrepancy.

2. Excluding Extra-Region.

3. Revised mid-year 2003 population estimates

4. SEE U:\Regional Accounts\New Regional GVA 1989 – 2002\Diversity of the regions 2002.xls for excel percentage breakdown of figures Source Labour Market statistics 2002 June 2002 (obtained by searching NS website archive by date and them)

VII Conclusions

The main conclusions to be drawn from this article are:

- The major drivers behind the majority of the changes or growth rates are due to the latest UK GVA estimates and the use of IR (PAYE). The IR (PAYE) data being used for the first time in the 1997 reference year and beyond.
- AT an industry level “Financial Intermediation” (industry J) has had the greatest effect on revisions at NUTS 1 and the greatest impact at NUTS 2 and 3 for the 2002 reference year.

April 2004 dataset

Blue Book 2004 national controls

Inland Revenue (PAYE) data

[illegible]

Revisions to ABI/2 data for manufacturing profits

Revisions due changes in national methodology for calculating non-domestic rates

Revisions due changes in Labour Market statistics on earnings and employment

[illegible]

Annex B – Background Notes

European System of Accounts 1995 (ESA95)

1. The estimates of GVA published in this article are consistent with the *European System of Accounts 1995* (ESA95). ESA95 is based on the *System of National Accounts 1993* (SNA3) which was sponsored by all major international organisations and is being adopted world-wide. The European system, which is being adopted by European Member States, is consistent with SNA93 but is more specific and prescriptive in certain parts. Introducing the *European System of Accounts 1995*, *National Accounts Concepts, Sources and Methods* (1998), and *Regional Accounts Methods* give more detail of the changed system of accounts, and the particular effects on the UK.

Regional GVA at basic prices

The NUTS2 & 3 1995 to 2002 final estimates published in this article are consistent with estimates of UK GVA published in *United Kingdom National Accounts Blue Book 2004*, NUTS1 1989 to 2002 GVA estimates with *Blue Book 2004*, and NUTS1 2003 provisional GVA estimates with *Blue Book 2004*. The Blue Book also defines the terms used.

Under ESA95, the term gross value added (GVA) is used to denote estimates that were previously known as gross domestic product (GDP) at basic prices. Under ESA95 the term GDP denotes GVA plus taxes (less subsidies) on products, i.e. at market prices. Regional accounts are currently only published at basic prices, so the figures are referred to as GVA rather than GDP.

Geography

The Nomenclature of Units for Territorial Statistics (NUTS) provides a single uniform breakdown for the production of regional statistics for the European Union. These are:

NUTS1 - Government Office Regions and Scotland, Wales and Northern Ireland.

NUTS2 - 37 areas within the United Kingdom

NUTS3 – 133 areas, generally groups of unitary authorities or districts, also known as local areas

Some areas appear at more than one level, for example, Northern Ireland appears at NUTS levels 1 and 2.

The GVA estimates relate to the nine Government Office Regions of England, as well as totals for Scotland, Wales and Northern Ireland. These form level 1 of the NUTS geography described above.

Regional GVA – concepts and definitions

In this article GVA is measured as the sum of incomes earned from the production of goods and services in the region. Insufficient information is available to estimate GVA for all regions of the UK using either the production or the expenditure approaches. Estimates of GDP for Scotland only, based on the

production approach, and measured in terms of constant (real) prices are published quarterly by the Scottish Executive. An article detailing the methodologies can be found in *Scottish Economic Statistics*, 2001 edition.

As described above, the estimates of regional GVA in this article are calculated as the sum of incomes earned from productive activity in the region. The income (referred to CoE under ESA95) of commuters should therefore be included in the region where they work. Historically, however, the estimates of regional GVA have not been compiled on this basis; but have instead been compiled using regional estimates of CoE on a residence basis, because this was the basis of the most reliable data source (the one per cent sample of Inland Revenue national insurance records). This has a significant effect on the estimates for London, the South East and the East of England regions, but is assumed not to introduce any significant distortion of the other regions. Headline estimates of GVA on a residence basis are given in tables NUTS1:1 to NUTS1:3 of this article.

Figures allocating the CoE to employee's workplace (the preferred GVA approach) are also included in this article, in table NUTS1:4. The workplace-based CoE figures for London, the South East and the East of England are based on regional data from the STES and the NES. There is, however, no industry breakdown currently available on a workplace basis.

Unless otherwise stated, all references in this article to regional GVA refer to residence-based figures.

Methodology

Sampling and non-sampling errors in the raw data sources used for regional accounts at a regional level give rise to the volatility in the regional GVA data. The regional GVA series headlined in this publication have been calculated using a five point moving average. These adjusted series remove some year to year volatility in the unadjusted series.

The underlying raw regional GVA estimates were produced using the same methodology as previous.

The methodology used to produce the raw regional GVA estimates was published in the December 2000 edition of *Economic Trends*.

Extra-Regio

The contribution to GVA of UK embassies abroad and UK forces stationed overseas is included in Extra-Regio, along with the element of GVA relating to activities taking place on the continental shelf. As these cannot be assigned to specific regions they are assigned as "Extra-Regio GVA".

Treatment of commuting in regional GVA estimates

Regional GVA can be calculated both on a residence and a workplace basis. Residence-based GVA allocates the incomes of commuters to where they live, whereas workplace GVA allocates their incomes to where they work. The GVA estimates presented here

are on a residence basis; and the breakdown of the totals by components of income and by industry are currently only available on a residence basis. However, workplace estimates are also provided in table NUTS1:4. The residence and workplace estimates are different from each other only in the regions of London, the South East and East of England. For all other regions it has been previously been determined from the Census of Population that net commuting between the regions is not significant.

General

All the items in the regional accounts are measured in current prices, which means that the increases over time reflect inflation as well as growth. Trends in total GVA per head of population cannot be analysed easily without deflating the data. However, there are no regional price indices that could be used to remove the effect of inflation from the figures. Comparisons of trends can be based either on the difference between regional increases at current prices or on movements in the amount relative to the UK average. Both approaches would be misleading if the rate of inflation in any region were different from the national average.

In the regional accounts it is usual to look at changes per head relative to the UK average over time. However, this obscures the effect of changes to the population size. In areas where the population is increasing most rapidly, growth in total GVA would be expected to grow relatively strongly; conversely, areas with a low or negative population growth would be expected to grow more slowly.

1989 to 2003 regional GVA per head of population figures will feed into the regional growth baselines calculated for the regional baselines calculated for the regional economic performance PSA target, jointly shared DTI, HMT and ODP. However, the regional GVA figures do not take account of the impact of price inflation at either the national or regional level. Due to this, the growth rates in this current price GVA per head of population series will not necessarily be comparable with any forthcoming regional growth baselines that will be set for this PSA target. The latter will be adjusted by statisticians in the DTI to take account of the impact of inflation at the regional level.

Accuracy

Although calculated as reliably as possible, estimates of regional GVA will not be as reliable as those for national GVA.

The regional GVA estimates are partly based on sample surveys and the quality of the results therefore varies according to sample size

The regional GVA estimates are partly based on sample surveys and the quality of the results therefore varies according to sample size. This means that the results for smaller regions may be subject to a greater degree of uncertainty than those for larger regions.

This article contains only a summary of the information available. A more detailed breakdown of manufacturing, and total regional CoE information are available on request from: Customer Contact Centre, Office for National Statistics, 1 Drummond Gate, London SW1V 2QQ, tel: 0845 601 3034, fax: 01633 652 747, email: info@statistics.gov.uk

Annex C

Inland Revenue Pay-As-You-Earn Quality Assessment (Technical Annex)

Paul Lucas and Gary Elston
Office for National Statistics
December 2004

Executive summary

- This report presents the results of the project carried out by the Office For National Statistics (ONS) Regional Accounts Branch (RAB) to assess the quality of the regional address information on the Inland Revenue's (IR) Pay-As-You-Earn dataset used in the compilation of NUTS¹ gross value added (GVA) and NUTS1-3 gross disposable household income (GDHI) estimates.
- The methodology employed matched records from the 2001/02 IR dataset with records from the 2002 new earnings survey (NES). The NES acted as a control to determine the quality of the IR residence address information, and to assess the affect incorrect address information might have on the IR regional distribution of total pay.
- Analysis of the results suggests that the IR regional data have no serious data quality issues at any of the NUTS levels.
- Between 85 and 95 per cent of the IR residence addresses are assessed to be consistent with the NES dataset at these NUTS levels.
- The regional distribution of IR total annual pay is, at each NUTS level, close to what it should be if all the IR addresses were aligned (based on the NES information).
- As a result IR data will be used in calculating NUTS1 estimates of GVA and NUTS1-3 estimates of GDHI. The project will be repeated in 2005 as part of the aim to repeat the work on a regular basis to ensure the validity of results over time.

1. Introduction

1.1 Report content

This report presents the results of the project carried out by the ONS to quality-assure the address information from IR regional Pay-As-You-Earn (PAYE) dataset, which is used in the compilation of NUTS1 gross value added (GVA) and NUTS1-3 gross disposable household income (GDHI) estimates. It summarises the project methodology, and concludes that IR regional data can be used to compile regional GVA and regional GDHI estimates.

1.2 Background

IR residence-based PAYE data are used in the apportionment of national accounts input-output compensation of employees (CoE) totals to NUTS1 regions in the compilation of NUTS1 GVA estimates and in deriving estimates of NUTS1-3 GDHI. CoE accounts for about two-thirds of regional GVA.

Before publication in December 2004, the IR data were only directly used for regional GVA for the period up to 1996. From 1997 onwards the IR control data were estimated using total earnings

¹ Nomenclature of Units for Territorial Statistics (NUTS) are a geographical, hierarchical classification showing an EU breakdown used for regional statistical comparison.

derived from employment² and average weekly earnings². This method uses a workplace-based series to estimate a residence-based series. IR data were not used because of data accuracy concerns from both within and external to ONS following the change in the IR database of National Insurance information from NIRS³ to NIRS2. GDHI used IR data up to 1999.

In early 2002, prior to the planned publication of NUTS1 GVA estimates for the period up to 2001, serious reservations about the quality of the residence address information on the IR dataset were expressed. In particular, the IR data were not picking up the latest addresses for people who had moved recently. It was decided that the best way to assess the quality of the address information on the IR dataset would be to match, on an individual case basis, the IR data to equivalent datasets elsewhere, without affecting data confidentiality. The NES was deemed a suitable control, as it is based on the same sample as the IR dataset - National Insurance numbers (NINOs) ending in two particular digits.

Revised IR data up to 2001/02 were made available to ONS in January 2004 following extensive quality-assurance work by IR and the Department for Work and Pensions (DWP).

1.3 Aim of the project

The aim of the project: to provide an assessment of whether the IR regional data are of sufficient quality to be used in future Regional Accounts' production processes. The project did not intend to assess the accuracy of the NES data. NES address information was assumed to be accurate and was used as the comparison 'control' by which to make an assessment of the accuracy of the IR data.

The project cannot definitively prove the accuracy of IR regional data. Instead, it began with a "null hypothesis" that the IR data are of suitable quality. Only if analysis produced significant evidence to show that the IR data are inconsistent in some way would the null hypothesis be rejected in favour of the conclusion that the IR data are not of suitable quality. In the absence of such evidence to doubt the IR data, the null hypothesis is accepted; therefore the IR data are suitable for Regional Accounts' use.

2. Summary of methodology

2.1 Data matching methodology

The project aimed to match records from the IR dataset with records from the NES, on an individual case-by-case level. These data are still covered under the Statistics of Trade Act 1947 and therefore strict confidentiality was observed for the duration of the project. Although the IR data and the NES data were matched at an individual level, the results were aggregated at the lowest level, NUTS3, in order to avoid disclosure.

The NES and IR dataset are based on the same one per cent sample of all NINOs.

Dataset preparation

NES data for 2000, 2001 and 2002, and IR data for 1999/00, 2000/01, and 2001/02 were made available for the matching exercise. The main variables were residence address (plus workplace address on the NES), annual pay and industry code. Records for duplicate NINOs were aggregated into a single record. Therefore that NINO became a unique identifier on each dataset. This means records on the datasets relate to people rather than jobs. Henceforth in this report, references to "NES datasets" and "IR datasets" mean datasets with aggregated NINOs.

² Growth rates in new earnings survey (NES) average earnings data are multiplied by short-term employment survey (STES) data on employee numbers to project forward the 1996 controls.

³ National Insurance Recording System (NIRS) is used by the Inland Revenue to collect contributions and holds more than 65 million individual contribution records

Matching the datasets

The NES and IR datasets were matched using the NINO variables. Records were matched if, and only if, they had identical NINOs. No records were matched using any other variables.

Resulting in the following data:

- Records successfully matched;
- IR records that were not matched to a NES record;
- NES records that were not matched to an IR record.

Quality of the match

For each pair of matched NES and IR datasets, the records that were successfully matched accounted for approximately 55 per cent of the IR records and 97 per cent of the NES records. It would be difficult to match many more records as nearly all the NES records were matched. The IR datasets are far larger than the NES datasets. Although the NES is drawn from the same sample of NINOs, it is subject to exclusions and survey non-response; this explains the difference. In addition, the IR dataset includes all individuals who have been employed at any point in the year, whereas the NES includes individuals who are in employment at a specific point in time.

Nevertheless, three per cent of NES records were not matched, but this is not believed to reflect unfavourably on the efficacy or quality of the match.

The three per cent that could not be matched can be explained by:

- Some NINOs may not be recorded correctly on one of the datasets (for example, a digit or two may be incorrect due to erroneous data entry), making a match impossible.
- A small percentage of NES records come from information supplied directly by large organisations of employees rather than the usual method of being taken from lists of National Insurance records. Some of these extra records may not be recorded on the IR dataset, since new employees can appear in tax records only after a time lag, and some temporary employees may not appear at all.

2.2 Analysing the matched data

This section explains the analysis carried out. The results of this analysis are presented in Section 3. RAB liaised closely with ONS' Methodology Group for the analysis stage of the project; they provided methodological guidance and quality assurance.

IR residence vs. NES residence

The primary aim was to compare, at each NUTS level, the IR residence address information with the matched residence addresses from the NES dataset control. ONS were interested in determining how many IR addresses appeared to be consistent with the NES and if there was any coherent pattern of bias among addresses that weren't.

Another investigation examined how the inconsistent addresses affect the *regional proportions of IR total pay* on a residence basis, as regional proportions rather than totals feed into the GVA and GDHI compilation process. Perceived biases were accepted in the IR addresses if it was determined that their effect on the regional distribution of IR pay was nil or negligible.

Collection of residence address information was only made a part of the NES in 2001. For that year, the information was only 90 per cent populated and a comprehensive quality assessment was not carried out. The compilers of the NES are, however, confident in the quality of residence addresses information for 2002. Therefore the main focus of this analysis was on IR 2001/02 data matched with NES 2002 data. Analysis of IR 2000/01 data matched with NES 2001 data was used only to check that the former was not throwing up any anomalous results.

Analysis of matched and unmatched IR datasets separately

The address information of the matched IR records could be analysed directly, as these records had a residence address from a corresponding record on the NES to check against.

However, the unmatched IR records could not be checked directly in this way and a different approach was required. The unmatched IR records had some different characteristics from the matched IR records; for example, their mean annual pay was considerably lower. It was felt that it could not be assumed, without supporting evidence, that the unmatched IR records necessarily had addresses that were as equally likely to be consistent with the NES as the matched IR records. Therefore it was deemed inappropriate to extrapolate that analysis of the matched data also applied to the unmatched IR records.

Instead, a new dataset was created that 'simulated' the unmatched IR records. A subset of the matched IR records was selected; it exhibited the main characteristics of the unmatched IR records – e.g. low mean annual pay. It was reasonable to make the assumption that the address information from the selected subset had a degree of accuracy similar to the address information of the unmatched IR records. Crucially, however, the selected subset was made up of records that *were* successfully matched with the NES. Therefore this subset could be analysed directly, and, by extension, so could the unmatched IR records.

Analysis of the whole IR dataset (see Section 3 for the results) was produced by combining the separate analyses of the matched and unmatched IR records. In particular these analyses enabled the derivation and comparison of:

- (a) the regional distribution of pay stated by the IR dataset, and
- (b) the regional distribution of pay that would occur if all IR addresses were aligned (based on the NES information).

NUTS aggregation

ONS compile Regional GVA and GDHI estimates using raw input data aggregated to NUTS1, NUTS2 and NUTS3 level. For compilation purposes, it does not matter if a person's IR residence address information exactly matches the address given on the NES, as long as the address stated lies in the same NUTS area. Therefore an IR residence address is defined as 'consistent' if it indicates *the same NUTS area* as stated by the NES. Some IR addresses may, for example, be consistent at NUTS1 level but inconsistent at NUTS3 level. For this reason, the analysis assessed the quality of the IR addresses at each NUTS level separately.

3. Results and proposals

This section presents the results of the analysis of the IR residence address information at each NUTS level 1-3, and makes proposals for the use of the IR regional data in compiling estimates of NUTS1 GVA and NUTS1-3 GDHI. The results presented refer to IR 2001/02 data matched with NES 2002 data.

3.1 Analysis on quality of IR data

NUTS1

Of the matched records, with valid residence address information on both the IR and NES datasets, 92.5 per cent of IR records had a residence address consistent with the NES at NUTS1 level. The simulation exercise indicated that around 93.6 per cent of the unmatched IR records are likely to have addresses consistent at NUTS1 level. This indicates that the unmatched IR records are as likely, if not more so, to have consistent residence addresses as the matched IR records. The analysis showed that 56 per cent of IR records were matched, and 44 per cent were unmatched. Therefore it can be concluded that the proportion of IR residence addresses that are consistent at NUTS1 level is:

$$(0.56 \times 0.925) + (0.44 \times 0.936)$$

$$\approx 0.930 \text{ (i.e. 93 per cent)}$$

This indicates that the majority of IR residence addresses are correct at NUTS1 level. Additionally, the inconsistent IR addresses are such that the regional distribution of all the IR addresses is statistically no different to the regional distribution of addresses if they were all consistent.

Analysis showed that the people whose IR residence address was inconsistent at NUTS1 level had a higher mean annual pay than those for whom the IR address was consistent. But the main concern is, if and how the small number of inconsistent addresses and their pay affect the *regional proportions of IR total pay* on a residence basis. To make an overall assessment of the IR regional proportions, the matched records' analysis were combined with the analysis of the sampled records that were selected to simulate the unmatched records. Chart A below shows the result: the regional distribution of total pay as stated by the IR data and the regional distribution that would result if all the residence addresses were aligned at NUTS1 level.

Chart A: Regional distribution of total pay from the whole IR dataset, as stated by IR and if all IR addresses were consistent with the NES, by residence address

Given the high proportion of IR residence addresses found to be consistent at NUTS1 level (shown on Chart A); that the regional distribution of IR total pay is close to what it is believed it would be if all the IR addresses were consistent; and the significant amount of work done by IR to quality assure the dataset - it is proposed to use the IR regional data.

NUTS2

Of the matched records with valid residence address information on both the IR and NES datasets, 89.4 per cent of IR records had a residence address consistent with the NES at NUTS2 level. The simulation exercise indicated that around 90.9 per cent of the unmatched IR records are likely to have addresses that are consistent at NUTS2 level, indicating that the unmatched IR records are probably more likely than the matched IR records to have consistent residence addresses. In the same way as the NUTS1 calculation, the proportion of IR residence addresses that are consistent at NUTS2 level is:

$$(0.56 \times 0.894) + (0.44 \times 0.909)$$

$$\approx 0.901 \text{ (i.e. 90 per cent)}$$

This indicates that the majority of IR residence addresses are consistent at NUTS2 level, and there are not significantly more inconsistent addresses at NUTS2 level than at NUTS1 level.

As with the NUTS1 exercise, the matched records' analysis and the analysis of the sampled records simulating the unmatched records were combined. Chart B below shows the result of this: the regional distribution of total pay as stated by the IR dataset and the regional distribution that would result if all the residence addresses were consistent at NUTS2 level.

Chart B: Regional distribution of total pay for the whole IR dataset, as stated by IR and if all IR addresses were consistent with the NES, by residence address

A high proportion of IR residence addresses was found to be consistent at NUTS2 level. As Chart B shows, the regional distribution of IR total pay is close to what is believed it would be if all the IR addresses were consistent. Therefore it is proposed that the IR regional data are suitable for use at NUTS2 level.

NUTS3

Of the matched records with valid residence address information on both the IR and NES datasets, 86.1 per cent of IR records had a residence address consistent with the NES dataset at NUTS3 level. The simulation exercise indicated that around 88.2 per cent of the unmatched IR records are likely to have addresses that are consistent at NUTS3 level, indicating that the unmatched IR records are probably more likely to have consistent residence addresses than the matched IR records. As 56 per cent of IR records were matched, and 44 per cent were unmatched, it can be concluded that the proportion of IR residence addresses that are consistent at NUTS3 level is:

$$(0.56 \times 0.861) + (0.44 \times 0.882)$$

$$\approx 0.870 \text{ (i.e. 87 per cent)}$$

This indicates that the majority of IR residence addresses are also consistent at NUTS3 level, and there is not a significant deterioration in the accuracy of IR addresses compared with higher levels of geography.

As with NUTS1 and NUTS2 levels, an assessment was made of the regional distribution of total pay for the whole IR dataset by combining the matched IR records' analysis with the analysis of the sampled records simulating the unmatched IR records. Chart C shows the result: the regional distribution of total pay as stated by the IR dataset, and the regional distribution that would result if all the residence addresses were consistent with the NES at NUTS3 level. This chart is found in Annex A.

As a high proportion of addresses are correct at NUTS3 level and the regional distribution of IR total pay is close to what it is believed it should be if all the IR addresses were consistent, it is proposed that the IR regional data is suitable for use at NUTS3 level.

4. Conclusion

Based on the results of matching records from the 2001/02 IR dataset with records from the 2002 NES on an individual record level; and the fact that the methods used were agreed by the ONS Methodology Group; the ONS has concluded that the Inland Revenue residence address information is of suitable quality to be used in the calculation of NUTS1 estimates of GVA and NUTS1-3 estimates of GDHI.

It is recommended that the project be repeated in 2005 with an aim to repeat the work on a regular basis to ensure the validity of the results over time.

1 The headline regional GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of regional GVA in this table are on a residence basis, where the income of commuters is allocated to where they live rather than their place of work.

3 Components may not sum to totals as a result of rounding.

4 Provisional

5 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline regional GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of regional GVA in this table are on a residence basis, where the income of commuters is allocated to where they live rather than their place of work.

3 Components may not sum due to rounding.

4 Public administration, national defence and compulsory social security.

5 Financial Intermediation Services Indirectly Measured.

NUTS1:3

Headline¹ Gross Value Added^{2,3} by industry groups, current basic prices by region 1991-2002

1 The headline regional GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 Provisional

5 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 Estimates of regional GVA in this table are on a residence basis, where income of commuters is allocated to where they live rather than their place of work.

2 Components may not sum to totals as a result of rounding.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

4 Provisional

1 Estimates of regional GVA in this table are on a residence basis, where the income of commuters is allocated to where they live rather than their place of work.

2 Components may not sum due to rounding.

3 Public administration, national defence and compulsory social security.

4 Financial Intermediation Services Indirectly Measured.

NUTS1:7 Gross Value Added^{1,2} by industry groups, current basic prices by region 1991 to 2002

1 Estimates of workplace based GVA allocate incomes to the region in which commuters work.

2 Components may not sum to totals as a result of rounding.

3 Provisional

4 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions

RN1:1 Revisions - Headline¹ gross value added^{2,3} (GVA) at current basic prices by region 1991 to 2002

1 The headline regional GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline COE series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based COE allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 Including Extra-Region.

5 Other community, social and personal service activities and private households with employed persons.

1 Estimates of workplace based GVA allocate income to the region in which commuters work.

2 Components may not sum to totals as a result of rounding.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based on GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

RN2:3 Revisions - Headline¹ gross value added (GVA)² per head indices by NUTS2 area at current basic prices

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 The GVA for Extra-Region comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 Components may not sum to totals due to rounding.

4 Excluding Extra-Regio.

5 Including Financial Intermediation Services Indirectly Measured (FISIM).

1 Estimates of workplace based GVA allocate to the region in which commuters work.

2 Components may not sum to totals as a result of rounding.

3 The GVA Extra-Region comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

NUTS3:5 Unadjusted (constrained to headline NUTS2) gross value added (GVA)^{1,2} by NUTS3 area at current basic prices 1995 to 2002

1 Estimates of workplace based GVA allocate income to the region in which commuters work.

2 The GVA for Extra-Region comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

NUTS3:6 Unadjusted (constrained to headline NUTS2) gross value added (GVA)^{1,2} per head by NUTS3 area at current basic prices 1995 to 2002

1 Estimates of workplace based GVA allocate income to the region in which commuters work.

2 Components may not sum to totals as a result of rounding.

3 The GVA for Extra-Region comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

NUTS3:9 Unadjusted (constrained to unadjusted NUTS2) gross value added (GVA)^{1,2} by NUTS3 area at current basic prices 1995 to 2002

1 Estimates of workplace based GVA allocate income to the region in which commuters work.

2 The GVA for Extra-Region comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

NUTS3:10 Unadjusted (constrained to unadjusted NUTS2) gross value added (GVA)¹ per head by NUTS3 area at current basic prices

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 Components may not sum to totals as a result of rounding.

4 The GVA for Extra-Region comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.

3 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

1 The headline GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which commuters work.
